> top-of-the-line/all-the-bells-and-whistles machine. But the rig wipes it out!

So it's probably not entering the VCR through the antenna spigots but I bet
you have some *other* cables (antennas) hooked to it (power, audio, video).
Unplug cables until the problem goes away. If it never does it may be the
power cable. Check out the ARRL Handbook's RFI chapter for suitable cures.

>Where can you look up or get a map with the grid squares labeled?

The ARRL has two publications available:

Title Pub # Price

Grid Locator (US and Cananda) 1290 $1.00
ARRL World Grid Locator Atlas 2944 $5.00

If you order them from ARRL HQ include a $3.00 S&H charge. It may be
best to either find them from a local dealer or wait until you order
something else at the same time.

Is anyone from this group going to be in Nashville for the USENIX
Conference the second week of June??

If so, what frequency might we get together on?? I will have 2 meters in
hand and 10 meters in the car. Or am I going to be all alone down there??

The Radius is a nice little radio that is well suited to your intended
use. There are other models in the Motorola line that would be nicer,
more power, etc, but the P10 is ok. One note, you do need a license
to operate these commercial radios, and you need a frequency assignment.
Normally these radios are shipped setup to use the so called itinerant
channel which is available nationwide on a non-exclusive basis. The
required license is merely a paperwork exercise.

Hey gang,

I have a dead Hewlett Packard 410C. HP wants more to fix the thing
than I paid for it ($0.00), sooo.. , does anyone have a schematic for it.
I'll be gald to pay reproduction and shipping costs.

Thanks,

Michael

>
There's got to be more to it than that. I regularly hear flutter, bubbly
sounding transmissions, and other effects that make it sound like the
other guy is underwater or gargling while talking. This often occurs while
talking to hams across town on 10 meters as well as short skip sometimes.
When the big solar flare occurred last March, even 80 meters sounded this
way. Its not uncommon on 2 meter SSB, either. A real explaination would
be nice.
Simultaneous short path/long path propagation is relatively rare, but I
remember listening to a fellow in Alaska talking to himself on 20 meters.
He was yelling "HEY!" every few seconds and listening to his echo. It
went on for almost an hour.

It's Ramsey, not Ramses. Ramses is either the name of a former Pharoh
or a manufacturer of condoms.

There was a review of some Ramsey products in the summer issue of Radio
Fun magazine, a new tabloid size publication of Wayne Green Enterprises.

is published every week and is made available for unlimited distribution.

* STS-40 LAUNCH DELAY *
=======================
A problem with an Inertial Measurement Unit (IMU) has forced the
postponment of STS-40 and the launch of Columbia at least until Wednesday.
The crew for STS-40 is Commander Bryan D. O'Connor, Pilot Sidney M.
Gutierrez, Mission Specialists James P. Bagian, Tamara E. Jernigan
and Margaret Rhea Seddon and Payload Specialists F. Drew Gaffney
and Millie Hughes-Fulford. The purpose of mission STS-40 is to perform
medical research in a micro-gravity environment.

* RS10 NEWS *
=============
Recent poor HF propagation conditions have created some good opportunities
for communication through Radio Sputnik 10's Mode A transponder. Contacts
can be made with very little uplink power. The auto-transponder is also
available on Mode A. Here is RS10's Mode A frequency allocation:

145.860 MHz to 145.900 MHz uplink yields 29.360 MHz to 29.400 MHz downlink.

Uplink Downlink
====== ========
29.357 MHz Beacon
145.860 MHz 29.360 MHz Passband limit, lower
145.870 MHz 29.370 MHz
145.880 MHz 29.380 MHz Passband center
145.890 MHz 29.390 MHz
145.900 MHz 29.400 MHz Passband limit, upper

145.820 MHz 29.403 MHz Mode A Robot (auto-transponder)
```

The Mode A transponder is a 40 KHz wide non-inverting transponder that supports all modes of operation, although AM, FM and other constant carrier, wide bandwidth emissions are not encouraged and should not be used.

>
>Any suggestions on good power strips would be most welcome.
>

There are possibly varistor-type devices in the surge protector that
are non-linear, thus rectifying any RF energy that may be present,
compounding the problems.

Keep in mind that most of the time the RF picked up by the AC line is
a common-mode signal, present on all 3 wires (including the "ground"
lead) in phase, with the earth connection acting as a return path.
Most AC-line filters do not filter the ground lead so are not
very effective against RF-induced AC-line interference. You can
form an effective common-mode AC-line filter by using about 10-20
turns of AC-line cord through a type 61 ferrite core, placed as close
as possible to the equipment that is experiencing interference. This
will have the effect of introducing a high impedance into the AC-line,
thus breaking the ground loop.

I would be more suspicious of a common-mode signal on any antenna or
coax (including CATV) feed to the VCR. Does the problem disappear
when the "antenna" coax is disconnected from the VCR? Mar 89 QST
has a common-mode filter that is effective against HF common-mode
signals, or you can use the type-61 ferrite as outlined above. If
you would like a hard copy of the Tech Department RFI handout, send
a large SASE with 52 cents postage to the Tech Department Secretary,
asking for the RFI package. It contains a reprint of the Mar 89 Hints

and Kinks column.

Type 61 ferrite is available from:

Amidon (818) 760-4429
Ocean State Electronics (800) 866-6626
Palomar (619) 747-3343

Have you contacted your section's Technical Coordinator? The TC can often supply hands-on help, or a referral to local TVI committees, etc. If you don't know your TC, contact your Section Manager (see page 8 of QST) or contact ARRL HQ.

Perry Scott writes...

>Back before the FCC ruled on the no-code tech, someone make the comment
>that code was too hard to learn. Well, I took it personally. If a
>dyslexic like me can do it, anyone can. Besides, I love a good
>challenge. I passed the written on the first try, and took two tries
>for the code.

I vacillated for awhile before deciding to write about my upgrade experience,
my first under the VE program (my last upgrade was from Novice to Tech
under the "steely-eyed examiners" at the FCC Long Beach office back in
1981)....

I went into the testing session with only about a week's worth of
13 wpm code practice...I was solid at 13, but not much more...conventional
wisdom dictates that you be solid at 2 wpm higher than the test speed
"just to be sure"....

Well, they decided to give the written first. What the h*ll, I decide,
might as well take a whack at 4a so I leave with an Advanced instead of
a General *if* I pass the code...needless to say, I had to activate some
gray matter I hadn't used since my days at the UCLA School of Engineering...
what's this? I should have brought a calculator, too?

To make a long story short, I passed 4a even being handicapped by "back of
the envelope" calculations and dim memories of tuned circuits....

Now comes the code...copied about 95% of the 13 wpm test and scored 10 out
of 10 on the multiple guess test...so now I'm sitting there with an
Advanced ticket (well, the credit, anyway) and now they start the 20 wpm
test. Feeling appropriately cocky, I decide to take a whack at that too...
copy about 10-15%...but manage to score *6* of out 10 on the test, only
one shy of passing...

So now I ask the VE's if I might go ahead and take 4B while they're grading
everyone else's papers...remember, I've not prepared for any written tests

at all, except for *what I've read here* and my eight-year-old BSEE...
dontcha know I passed 4b, too!

>
>I'm reporting to the net that attaining 20 wpm isn't hard, just tedious

Sadly, I have to agree...thought I'd feel different, going straight from
Tech to Advanced...but ya know, I still put my pants on one leg at a time...

>
>The worst part about changing callsigns is the funny way I ID: "This is
>KF-zero... er AA0ET". Really confusing for the guy on the other end.
>
>
>Perry Scott
>AA0ET (temporary KF0CA)

Same here..."this is WD6, uh, NH6ZW"...see my earlier posting about
changing calls...

I'm not quite sure what to make of all this...it just seems like upgrading
ought to require more effort than I put in to it...now I'm not going to
try to map my experience onto everyone else, but to those who argue that
the tests are *too hard*, I'm afraid I just can't agree anymore...methinks
that many of the barriers to upgrading are psychological blocks thrown up
internally or by others...particularly distressing is the fact that I almost
passed 20 wpm almost entirely by guessing....I'm now more convinced than ever
that our whole licensing scheme needs a major overhaul, a comment I made back
when the no-code debate was going on....

If anyone is interested, this was a W5YI session and no, not everyone passed
all elements attempted...I seem to recall the examiners recording about a
67% pass rate on individual elements.

Followups should probably go to the policy group, although I don't have access
to it yet, or to me personally at 1843EIP"at"Hickam-EMH.AF.MIL.

73,
Jeff Miller NH6ZW/AA AFA8JM/AFF8A/AFF8P

>then run full power SSB afterwards. Could this be a general misconception
>contributing to a lot of the high powered splatter on the HF bands? Hard
>to say, but I think that it is worth considering.

Too right! If you intend to run a legal limit SSB amplifier, you *must*
own the proper dummy load. You must tune your amplifier to twice the
legal CW power for it to be properly tuned for SSB operation at the
legal limit. Otherwise all the ills you specified will likely occur.

Since the FCC has put legal restrictions on new commercial amplifiers that
make steady state tuneup at twice the legal power impossible, you flat
can't tune a current commercial amplifier properly using the old key
down techniques. A scope, a couple of stack temperature probes, an audio
generator, and a good understanding of your amplifier is required to obtain
correct drive, tuning, and loading of a legal limit amplifier.

After a bit of practice, you'll get a good feel for the depth of dip
your amplifier exhibits when properly tuned and loaded and can dispense
with the test equipment for practical purposes. Of course you should
always tune up your antenna tuner with a noise bridge *first* before
attempting to transmit through it.

Running barefoot sounds better and better doesn't it?

Gary KE4ZV

19. Re: VCR RFI

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-02 16:05:13 UTC
From: flash@lopez.UUCP
Message-ID: <1991Jun2.160513.10830@lopez.UUCP>
Source record: 296296

Well if you run power on 75 meters (I do) you will not make your
neighbors with VCR's happy. The problem is this:

Videotapes are recorded in the frequency spectrum of 0 to 4 megahertz.
Video heads are little coils of wire used to pick up the minute RF (It
really IS RF folks, teeny tiny RF signals whizzing past the spinning
heads)... The heads are connected to high gain video (again since it
goes up to 4 mhz, these are in reality RF) amplifiers.

So when you are trying to get 75 meter signals out of a vcr, you are
trying to stop a high gain amplifier from detecting signals it was
DESIGNED to receive.

Here is the best you can do:

Put RF chokes on the POWER, VIDEO, AUDIO and ANTENNA leads. Use those
little TV interference filters (You will have to hook transformers to
them to make them 75 ohm) they really do work on fundamental overload.
BUY a VCR that has an all metal case, a substantial one.

This will minimize the problem. If your station is well grounded, you
can count on that helping *some*... BUT remember. The VCR is a high
gain 75 meter receiver. Your job is to make sure it has no antenna, but
it is virtually impossible to get the RFI out of a vcr totally on PLAY
(you can eliminate it from record and get it out of the tuner section
for watching TEEVEE), but you can not fully eliminate it.

Now you now why.

By the way, I have 6 vcr's of varying age (9 if you count the UMATICS)
and interestingly, the expensive ones DO work better in the RFI regard.
They have better shielding, and though I have not looked at any
schematics, it is possible they even have some RFI filtering, which USED
to be standard on consumer electronics (and no longer is)

Do like me, and do your high power 75 meter operations between midnight
and 6 am. Most people who work for a living are sleeping. The ones
that ain't (no job) can not afford to make trouble for you, and may not even
be able to afford a VCR :-) (well actually MOST welfare recipients have or
rent VCR's these days, so belay the last)_

20. MAJOR SOLAR FLARE ALERT - 02 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-02 18:08:40 UTC
From: oler@HG.ULeth.CA
Message-ID: <910602120840.21c0121b@HG.ULeth.CA>
Source record: 296288

-- MAJOR SOLAR FLARE ALERT --

JUNE 02, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

Another major flare of lower intensity erupted from Region 6659 (this is the region which spawned yesterdays spectacular > X12 flare). Todays major event was rated a class M5.2 and was not optically correlated due to the continuing poor position of Region 6659. No significant sweeps were observed from this event. The event peaked at 07:41 UT on 02 June.

Region 6659 is just barely becomming visible at this writing. No details can be discerned yet. The region appears to be centered near N25, although this could change once the region becomes more fully visible. At the present time, an area of plage is rotating into view, but no significant spot detail can be seen.

More will be known in the days to come.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

There will not be any terrestrial impacts from todays major class M5.2 flare. However, there will continue to be radio impacts (SIDs/SWFs) from the major and minor flaring which is occurring in the various regions on the solar disk. There is a continuing potential for major HF signal degradation and blackouts over the sunlit portions of the hemisphere.

There is an increased risk for proton and possible PCA activity from Regions 6652 and 6654, which are now within high-risk zones, if major flaring should recur.

There is a relatively high probability for several more X-class flares from Region 6659 over the next week.

Watch for future major flare alerts, and possible warnings.

** End of Alert **

21. Need help: Xerox 1810 system

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-02 23:40:33 UTC
From: mac@cis.ksu.edu
Message-ID: <1991Jun2.234033.14905@maverick.ksu.ksu.edu>
Source record: 296290
Cross-posted to: comp.sys.xerox,comp.os.cpm,rec.radio.amateur.misc,comp.sys.zenith.z100

For a (very short) song I just acquired a Xerox 1810 "laptop" computer, external power supply, and an 1845 dual disk drive unit at a hamfest. The seller claims it is supposed to work, but I'm still waiting for the internal battery pack to charge. (The battery is probably bad, but I'll give it a chance to charge before I dig into it!) I also received a notebook containing an "installation guide" (how to turn it on, where to plug in this 'n that, how to set the clock, etc.), but I have no information on the BASIC which is supposedly inside, nor how to get it to run CP/M, nor how to access the disk drives, etc....

I bought it mainly for a portable packet radio terminal, so if I can learn how to use BASIC and access the ports, I'll not have lost my $25; anything else will be "gravy"! Can anyone email me any further information?

FIELD DAY OSCAR OPERATIONS

HR AMSAT NEWS SERVICE BULLETIN 152.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 1, 1991
TO ALL RADIO AMATEURS BT

Field Day '91 Offers Prime Opportunity To Demonstrate Emergency OSCAR Ops

Field Day is only 3 weeks away and many of its more avid participants are
busily working on the preparations for their own or a club's efforts for
one of amateur radio's most exciting annual events. By now most of the
serious entrants have already picked their FD site, decided on how many
stations they will have in continuous operation, how much insect repellent
they will need and what kind of "imbibement" will be necessary for such
a long and arduous event. This year, AMSAT would like to encourage all
those radio amateurs involved in FD planning to consider adding an OSCAR
station. Over the past several years many OSCAR stations have started
to appear at FD sites. And if you are an active OSCAR user, this is an
excellent opportunity to demonstrate the exciting possibilities of emer-
gency traffic-handling using the message handling capabilities of the
PACSATs or the long-haul links on AO-13. If you don't wish to drag-out a
complete Mode B or Mode J station to the FD site, then consider working
one of the "easy birds," RS-10/11 or RS-12/13 with their simple Mode A or
KT transponders. Many hams will be suprised how easy it is to make a
contact through an RS bird. Also, this year radio amateurs have the added
bonus of using the newly operational low-earth orbiting AO-21 with its
Mode B transponder designed especially for amateurs with simple stations
and using QRP power. Recent users of AO-21 have commented on the
excellent signals coming from AO-21 using its Mode B transponder.

If you are involved with a OSCAR FD operation and would like to have it
featured in an OSCAR FD summary, AMSAT Journal Editor, Drew Deskur (KA1M)
would like to hear from you. Please send him a photograph of your FD
station and a short synopsis of your operating experiences. Please send
it to KA1M, 19 Parker Dr., North Reading, MA 01864. AMSAT would like to
wish all FD particpants "good luck in the contest. QRZ FD."

SSTV EXPERIMENTS ON AO-13
```

HR AMSAT NEWS SERVICE BULLETIN 152.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 1, 1991
TO ALL RADIO AMATEURS BT

Results of Slow Scan Television Experiment, 30 May - 1 June 1991

A recent SSTV experiment on AO-13 resulted in several check-ins from the US, Canada, and Japan. Pictures were exchanged successfully on both Modes B and J. Dave, WB6LLO, who organized the test, acquired ROBOT gear about an hour before the first test started and did a hasty cabling job before the first session! He was assisted by Mark, NU6X. Tests were held on 30 and 31 May and 01 June 1991. Frequencies were downlinks of 145.950 and 435.980 on modes B and J respectively (in case you were tuning by and wondered what that strange sound was).

If you are interested in hearing more about these tests or possibly participating in future SSTV sessions, contact WB6LLO via LUSAT, PACSAT, FO-20, Internet as wb6llo@tomcat.gsfc.nasa.gov, or at (619) 275 1495. He is also usually present on AO-13 Operations Nets (check the net schedule in a separate ANS bulletin).

[ANS thanks Dave, WB6LLO, for the information in this bulletin.]

AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 152.04 FROM AMSAT HQ
SILVER SPRING, MD APRIL JUNE 1 1991
TO ALL RADIO AMATEURS BT

AO-13 Spring Schedule, AO-10 Not Presently Available

The AO-13 transponder schedule which expected to continue through 17JUL91 is:

Mode-B : MA 000 to MA 095 !
Mode-JL : MA 095 to MA 125 !

Mode-LS : MA 125 to MA 130 !
Mode-S : MA 130 to MA 140 ! <= Mode-B transponder is OFF !!
Mode-B : MA 140 to MA 256 ! Perigee eclipses, (max 29 mins)
Omnis : MA 240 to MA 030 ! from May 21 until end September.

The current Spacecraft attitude is:

BLON = 179.4 BLAT = -1.6

Note: although you can hear the mode B beacon from MA 130-40,the transponder is OFF. Please DO NOT uplink carriers, whistles, swishes etc. at MA 130-140 as it severely interferes with mode S users.

Currently, OSCAR-10 is not receiving sufficient solar panel illumination to support the transponder. PLEASE DO NOT attempt to use OSCAR-10 until further notice. This period of dormancy is expected to end soon. As soon as OSCAR-10 can support Mode-B transponder operations it will once again be released for general use. Early reports of OSCAR-10's beacon returning to full strength can be sent to VK5AGR @ PACSAT-1 (aka AO-16), @ UOSAT-3 (aka UO-14), @ 8J1JBS (aka FO-20), or @ VK5WI. 73, Graham VK5AGR

SB RTTYDX @ ALLBBS $KT7H151
RTTY DX Notes 1of3 5/31/91

RTTY DX Notes for week ending 31st May 1991
BID: $KT7H151
Part 1 of 3.

From what I have seen, every BBS and mail system seems to have its own
ideas about bulletin identification. I have seen some bulletins with
as many as 15 identifications in the headings. Now that's a bit
foolish and time wasting. Would it not be more logical to adopt one
system of identification, so that everyone can do the same thing?
Changing the original identification only leads to the same bulletin
arriving at a BBS from various sources many times. This causes the
BBS to be filled with redundant and repetitive information. This also
causes the sysops many hours of non productive work. Think about it.

Our thanks this week go to DJ3IW and the DB0SPC cluster, I5FLN,
JA1ACB, JR1RVN, K4FJ, LZ2BE, NT3B, OD5NG, TG9VT, VK2EG and W2FG.
Thank you all for your assistance, and hope more good DX turns up this
week.

QSL Information:

Not much in the way of addresses this week, but we have some.

4J1FS will QSL via OH2BU for his RTTY contacts.

KG4DD is Doug Donley, Box 692, FPO New York, NY 09593-5573.

V63BN will QSL via JG1NBD.

FB8WZ says to send his cards to Box 3, Communications Office, Crozet Island, Indian Ocean.

HI3AB will collect his cards from his callbook address of HI3ADI.

Notes of Interest:

FB8WZ (Crozet Island) prefers English QSO's, as he is trying to improve his English.

The group who was on St Peter and Paul's Rocks had computer problems, so understandably there were no RTTY contacts and we believe very few CW contacts either.

Information still trickles through that Romeo will be going to Burma in the June/July time frame with two operating positions, but nothing definite as yet. Keep fingers crossed.

There has been no sign of HF0FOL who said that he was going to the Shetland Islands late May or early June. But who knows? There may still be hope.

26. Satellite Formula's

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-03 01:46:38 UTC
From: gerwitz@Kodak.com
Message-ID: <1955@eastman.UUCP>
Source record: 296297

I am posting this for a friend without news access. Please respond via email to: ...kodak!eastman!hpcore!dieter

From: Mark Dieter, N2BLI

Does anybody know where I can find the "definitive" set of formulas to predict the location of satellites in earth orbit ?

I am trying to write a program to aim my antennas at amateur satellites. Unfortunately I cannot use the PC based programs, and I don't know much about orbital mechanics. HELP !!!

27. Alinco HT mods & comments request

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-03 03:19:13 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <6695@vela.acs.oakland.edu>
Source record: 296294

And once again, another mod request..

I need mods (out of band RX and TX) for the following Alinco HTs.
Any help would be greatly appriciated.

Alinco DJ-160T (2m HT)
Alinco DJ-460T (440 HT)
Alinco DJ-560T (dualband HT)

Also, any comments on the above HTs would also be appriciated. These
Alinco HTs seem to be priced very well and loaded with features.

thanks (in advance),

Steve Kuo, N8OPH

28. Another rugged equipment story

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-03 05:01:06 UTC
From: tjsandoz@king.mcs.drexel.EDU
Message-ID: <9106030501.AA20959@mcs.drexel.edu>
Source record: 296292

Somewhere (maybe "Plastics World" or some other polymer rag) I read that Motorola had done extensive R&D to develop not only a tough plastic but also a ht case design providing great protection of the innards...

It seems that a large number of their radios "inadvertently" strike other "things" (someone mentioned nails, but in the law enforcement business other things are "accidentally" struck by the ht...just watch FoxTV "Cops") Note I said nothing about the legality of this, nor do I own a cam-corder nor do I live even near L.A...end of moral/social/ethical/*.* disclaimer.

Now, how do you go about testing this "feature"? It's not in any of the environmental test books I own....I don't think the shake and bake + spin cycle adequately covers it :) And I thought ESD/EMI was the hard part.

And, gosh, nobody will ever catch me throwing my ht across the room, but I wonder how it would do in self defense. (Drexel = Phila PA) Hope that day never comes.

29. Query on low-level assembler programming of radio/scanner CPUs

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-03 06:01:43 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1991Jun3.060143.1760@midway.uchicago.edu>
Source record: 296298

Here's some pretty naive questions... but these CPUs inside Ham and scanner radios have got me... well... fascinated !

1. Hmmmm... My ICOM 24AT, TS-950 and PRO2006 all have "CPUs" that control the radio. When I look at a service manual and reference is made to the "CPU" this "CPU" is some funky CPU. These are not common CPUs that one might find in a computer. Exactly how are these CPU (micro processors) in radios and scanners UNLIKE traditional CPUs found in computers ?

2. Clipping diodes. Hmmmm. "Clip diode Dxx to enable undocumented feature 'X'". This is what I usually see posted regarding restoring deleted 800 Mhz coverage on scanners (like the PRO 2006). I assume this is one of the many "inputs" that the CPU can sample and thus decide (via the program) to synthesize or not synthesize a particular freq (I assume this is how part of 800 Mhz is "deleted". Beyond this ... the CPU must scan the keyboard, detect the presence of a signal etc... What kind of I/O are these devices (CPUs) capable of ? (And, by the way, HOW DOES the CPU synthesize the freq.. what kind of component does this control?)

3. Are the instruction sets for these CPUs readily available? Are these CPUs in radios custom chips or chosen from a "standard" set of such CPUs. How about the possibility of reading a radios program ROM, dis-assembling the program at the instruction level, modifying it and blasting this into an EPROM. The ultimate mod or beyond possibility? (I assume no reasonable person would want to do this. However, I have seen a .BIN file for the TS-440 so I assume someone has at least gone through the trouble of snatching the program code from ROM.) Sounds interesting.

Anyway, thats what I'm thinking about these days. Looking for some answers or someone who can point me to a "good book" on the subject. I'm sure its all out there - I just dont know where to look.

Thanks,
Gary / KE9ZM

Subject: Radio Shack's at it again...

Not to start an old flame-fest again, but I thought I'd report on an interesting experience I had at the local Radio Shack in Wahiawa last week...

I went in to buy some cable clips and when I paid cash, the clerk asked me for the last 4 digits of my *Social Security* number...as is usually my practice, having been recommended in this forum, I made up a random 4 digit number and gave it....being in a hurry, I didn't want to get into a long-winded discussion with the clerk or the manager about it, either, but I just wonder why they apparently changed their procedure on what the "magic number" is.

No, I haven't visited any other RS's on Oahu to see if this change is universal...

Granted, there's not a whole lot they can get just from the last 4 digits of yer SSAN, but why ask for something that most assuredly will cause more people to bitch than asking for the last four of their phone number....?

Yours for a fine debate...73,

Jeff Miller NH6ZW/AA AFA8JM/AFF8A/AFF8P

Wayne_A_Lightsey.Roch809_XBS@xerox.com writes:

>Another wierd thing happened a while ago. I was listening on 10
>during the afternoon, and a few of the stations sounded like they had
>echo-reverb microphones. The echo was delayed by about 1/4-1/2 second.

This is a propogation phenomena frequently associated with VHF work bouncing
signals off the Northern Lights (aurora borealis). It is a "natural" echo due
to multipath propagation. It is probably associated with the solar flares
recently occurring that seem the affect all ham bands more or less.

Hmmm. Is that really so? 1/4-1/2 second is about 50,000-90,000 miles.
The ionosphere is only order 100s of miles above the surface, and the
earth's circumference is 1/3 that distance. I can see where VHF aurora
bounce could cause fading or flutter on those timescales, but echo? Even
the moon is only 2-3 seconds round-trip.

On HF, I have heard what I presume are longpath/shortpath combinations with
a ~1/10 second delay, but even that's going around the world.

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 013 (OPDX.013)
June 3, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, ARRL DX Bulletin, WB3LHD, W6CF, NA8A, K8CH, W8GMH, WB8HIW, W8XD, K8YSE and K9ES for the following DX information.

4K1, ANTARCTIC ZONE 39. Nick, 4K1A, says to listen for him on 80 meters, 3503 KHz between 0100Z and 0300Z. He claims to have good conditions to the USA at that time.

7P8, LESOTHO. Mary, 7P8DF, is a new addition to the amateurs in Lesotho. She can be found on the W7PHO Family Hour DX Net in the mornings at 1200Z. Mary can be heard better long path at this time frame.

9U, BURUNDI. Larry, G4BZP, is working in Burundi and signing with the callsign of 9U5BZP. He will be there until about June 28. His operating schedule is as follows: 0400-0530Z, 1000-1200Z and then 1500Z-until the band closes. He can be found around the following frequencies +/- 5 KHZ: 14279, 21279 and 28507. He goes by call areas and first letter of your suffix (very slow process, BE PATIENT!). QSL via G4BZP.

D2, ANGOLA. LZ2DF and the group from UB5 finally hit the airwaves Saturday, June 1, around 2045Z. Two stations were up and running signing D2ACA. They were first heard on 21025 KHz and then moved to 21275 KHz an hour later. They were also heard later around 7001 and 14276 KHz. On Sunday they were heard on 28026 KHz around 1600Z. This operation should last until June 9th. QSL via LZ2DF.

ET, ETHIOPIA. As of May 28th, Jack, ET2A, is safe and has relocated, presumably, inside the U.S. Embassy compound. He has put up a vertical antenna and was operating on the 28th. He is to leave June 8th.

FR/T/G, TROMELIN/GLORIOSO ISLAND. One of the Net Control Operators of the INDEXA Net, reported that those who missed FR5AI/T may get another chance. FR5ZU is planning a return trip to Tromelin and Glorioso sometime this year. No dates are yet available.

KC6, WESTERN CAROLINE (REP. OF BELAU). Emil, KC6KW, has been very active this week. Activity seems to be mainly CW. Check around 14025 KHz from 1230 to 1430Z, 21025 KHz from 1900 to 0300Z and 7006 KHz around 1100Z. QSL via AG9A. Also, KC6XX, who is part of the KC6KW

group was also heard this week on 14200 KHz at 1218Z. They will be departing the island soon for Guam. Apparently there were many questions asked about their KC6 prefix. This prefix is still a valid prefix for the Western Caroline Islands as opposed to the V63 prefix used for Eastern Caroline Islands (now Micronesia).

KH7, KURE ISLAND. Rick will be signing KH6JEB/KH7 from Kure Island for about another two weeks. Most activivty has been on DX Nets. Check the 14222 DX Net around 0200 to 0400Z and also the 14256 DX Net after 0400Z. Better work this one, because it may become rare. The Naval base on Kure Island will be closing some time this year. QSL via home address.

P29, PAPUA NEW GUINEA. Steve, G4JVG, is now signing P29DX from Port Moresby. He has started to show up once again on Sundays, 14200 KHz at 1200Z. QSL ONLY to Box 1783, Port Moresby, Papua New Guinea.

PJ8, ST. MAARTEN. Bill, K1MM, is active as PJ8MM. Bill has been heard on CW at 14019 KHz around 2300 to 0200Z and on SSB at 14165 KHz around 1200Z. There have been other QSN reports on 10 and 24 MHz. QSL via K1MM.

TL, CENTRAL AFRICIAN REPUBLIC. Pat, TL8FD, is a new amateur in this country. He can be found on 14026 KHz at 1300Z most mornings.

V6, MICRONESIA. Plenty of activity from here this past week. V63BN has been showing up most mornings at 1200Z on 14024 KHz running the pile-ups for this semi-rare "CW" country. Also, V63BN has been heard on RTTY on 14088 KHZ around 1130 to 1330Z. V63ST and V63JC have both been active on 20 meters SSB. V63JC on 14151 and 1465 KHz around 1130-1200Z. V63ST on 14197 around 1130-1230Z and QSL to KB6CC.

DXCC NOTES. By uanimous vote of 7 to 0, the ARRL Awards Committee approved the DXAC's recommendation of DXCC country status for the Penguin Islands. The recommendation was based on Point 3 (a) of the Countries List Criteria, "separation by another DXCC country". Namibia (V5) is between Penguin and Republic of South Africa (RSA). The Penguin Islands are governed by the RSA. Cards for DXCC credit will be accepted starting September 1, 1991 and cards received before that date will be returned without credit given. The effective date is November 15, 1945. Although no known operation has taken place before the ZS9AAA/1 and ZS9Z/1, QSLs from both operations will be acceptable. This addition brings the DXCC Country Total List to 323.

UPDATE. Thanks to Eric, K9ES, who has been keeping everyone informed about the progress of Dave Porter, ZD8DX. As of last week, Dave was in good spirits and the doctors are amazed at how quickly some movement is returning to his legs. Surgery was planned for May 28th, when doctors will place a set of pins in the broken thorascic vertebrae. No word on how the operation went. Listen for updates direct from Dave and others on 14165 KHz at 1030Z.

QSL CARDS IN THE MAIL. Cards for 3C1EA, C9EC and some of Kiyoko's cards have been showing up from her Dxpeditions (ZK3KY, ZK2KY, T30KY, T31KY).

Good Luck on DX de KB8NW

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. 34. 10 meter band summer vacation

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-03 12:07:09 UTC
From: MROWEN%STLAWU.BITNET@cornellc.cit.cornell.edu
Message-ID: <9106031214.AA01831@ucsd.edu>
Source record: 296301

Sporadic-E (Es) is, as you can guess from the name, sporadic.
Consequently, it's uncommon for 10 meters to be open for more than a few hours
at a strech. The best times are late morning and early evening, local time.
The worst times for Es are after midnight and early afternoon, local.
However, Es can happen anytime and often pops up MUCH more frequently
during late June to mid-July.

The main difference between 10 meters and the 160-20 meter bands is
that F2 is less common and so conditions are less predictable. But when
10 is open, you can work thousands of miles with only a couple of watts.
I have worked Central America while running less than 10 watts to a
Heath Cantenna (i.e. the other guy could hear just my HW-101's leakage).

Mike

Again not an amateur story but....

I used to work for a company that manufactured a 90V 3000amp (3000 is not a typo) power supply for the Fermi labs several years ago. They were in for acceptance of the equipment and the engineering manager was talking about the crowbar circuit. One of the customers questioned him on it so as a demonstration he picked up an available crowbar and dropped it across the power supply output. The power supply shut down nice as you please with no complaints.

|>
|>Jon
|>N1ILZ
|>
|>jmccombie@bbn.com OR
|>{harvard, other backbone}!bbn!jmccombi
|>
The impedance of the antenna is probably nowhere near 450 ohms, so it doesn't
matter much whether you match the 450 or not. In other words, pick whatever
ratio is convenient.

Be sure to use fat cable (RG8 or similar) partly because you'll have high
SWR (so you need low loss cable) and partly because that high SWR means
high peak voltages (so you need cable with high voltate ratings).

Since voltage baluns can saturate, while current (choke) baluns rarely
do (see June '91 QST), this sounds like a job for the latter.

Are current baluns more expensive? If so, perhaps just because there
are enough people around who will cough up the money. You can make your
own very easily, of course. The other possible reason is that they tend
to use a lot of ferrite. (That, incidentally, is the reason why they
don't tend to saturate; Belrose's claim in the QST article that they
can't possibly saturate, or that it wouldn't matter if they did, clearly
doesn't hold water.)

41. Contact wanted w/ repeater owners and servicemen

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-03 14:54:23 UTC
From: benjamin@ee.tut.fi
Message-ID: <1991Jun3.145423.20720@funet.fi>
Source record: 296312

I posted here some time ago on talmost the same matters, but I still
won't believe this forum is only for repeater users and users-to-be.

I have got my thumbs sore while tinkering with a VHF machine and also
my throat sore with an UHF machine (the QTH is not blessed with what
you could really call a heating system...).

These two are subjects well known also up here, so I have got plenty
of good advice from the icebears.

Now we are moving up and down - i.e. plan repeaters for ten and 23 cm.
We are also planning some additional features to the existing machines,
like diversity reception on VHF and a couple of sub-receivers around
the town on UHF. We would also like to know more of ctying several
machines situated in the same QTH together on AF.

So, I would like to exchange ideas with you out there, if you have
experience in repeaters, or if you want to know more. Maybe I can post
here a digest of the discussion.

From: hatzakis@eva.stanford.edu
Message-ID: <HATZAKIS.91Jun3172649@eva.stanford.edu>
Source record: 296321

I would like to purchase a TS-120 or 130 radio. Please let me know if you would like to sell one or if you might be able to reccommend a place that I could buy one, ie., used gear places like AES.

Thanks, Mike (P.S. If you responded to this note before, I had a typo on my return address...)

Well, I did just that very thing Sunday morning, and what do you know!
I was able to receive LOTS of great signals. I guess timing is a lot
more critical on 10m than on 40m. A lot more critical than the books
led me to believe. I guess experience weighs a lot more than book-learnin'.

However! I was not able to get Texas or Oklahoma to respond. Oh well.
I'll try again next weekend.

Thanks 1.0E6 for the advice.

|> > > from the feedpoint of the GP Vertical I use on 10m. The TV had
|> > > no TVI on any channel, but the VCR lost both picture and sound
|> > > each time I keyed the mic.
|>
Well, I have more information on this problem. I am now also getting
audio inteference on every device in the cabinet with the VCR on 10m,
but only problems during play on 40m. It appears to be coming in through
the AC line. But further investigation seems to indicate that the
cheap surge protector/line filter I have everything in the stereo
cabinet plugged into is generating the noise from the RFI. For some
reason the vertical GP antenna causes this power strip more problems
than the G5RV. I'm going to replace it with a higher quality power
strip that will actually filter RF instead of amplifying it.:-(

Any suggestions on good power strips would be most welcome.

Glad to know I'm not the only one waiting for this one. Also glad
I didn't waste any more IRC's. Guess I'll just wait for another KH0
to come along. Kinda bugs me to have to spend "DX" postage for a
US call, especially when they'll probably mail the returns (if they ever
do) from KH0 land for $0.29.

Re: warbling

Over-the-pole operators put up with auroral distortion. You might want to listen on 20 meters for some U* or R* stations and see if this is the effect you are hearing.

I've heard that multipath can also exist over non-great-circle paths. The ionosphere, especially around the poles, is not regular. The refraction bends the wave to the side, as well as downward. The idea of short/long-path multipath sounds the most plausible.

Working yourself via longpath sounds like fun. Working yourself via sattelite is fun, too.

I noticed that people on the net were keeping track of how long it takes to get your license so I thought I would post for those who care. I got my Novice License in about 4 weeks. I passed the test on April 30, 1991 and the license effective date is May 28, 1991. I got it June 1. It had a serial number of 02265 on it. I was surprized when I got it because I was expecting to wait 6 to 8 weeks. I guess I better hurry and get my station put together now.

55. Reprogramming the AR1000

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 00:22:30 UTC
From: schuster@panix.uucp
Message-ID: <1991Jun4.002230.25098@panix.uucp>
Source record: 296184
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

There seems to be renewed interest in this, so I thought I'd post Lionel's article once more. After reading this I tried it on my older vintage AR1000 and successfully moved the low frequency limit from 8 to 0.5 mHz. Your mileage may vary. Anything which results from implementing the instructions below is AT YOUR OWN RISK.

Lionel copied these instructions from a factory set up sheet, sent to him by his dealer when the CPU locked up (a rare event), rendering his radio dead. It is also reproduced in the service manual, available from AOR Japan (no, I don't have the address).

==========
AR-1000 Reset Procedure
==========

* What you need :

- A small Philips screwdriver
- A soldering iron (30 W max)

* What to do :

- Remove the antenna
- Remove the batteries
- Remove the tuning, volume, and squelch buttons
- Remove the back cover (4 black screws), and disconnect it from the rest

- Lay the unit flat on the table, keyboard and display below, antenna connector away from you
- Unsolder the black wire from the lower right corner of the upper board
- Unsolder the brown wire from the upper left corner of the same board
- Remove the 3 screws that hold this board
- Pull GENTLY this board out of the upper panel (volume, squelch, and tune rods come with the board - not the antenna connector)

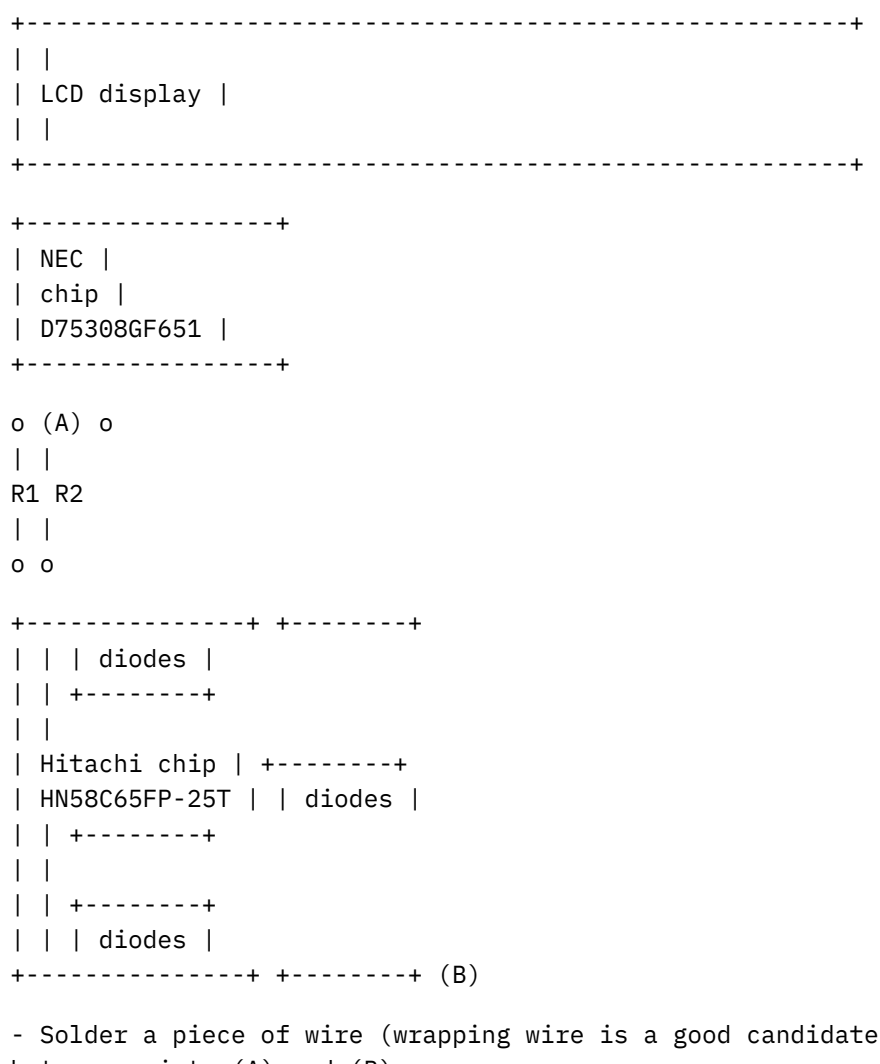
- Unsolder the black wire from the upper left corner of the middle board
- Unscrew the 3 copper columns that hold this board

- To get a better access on the lower board, you may wish to remove some of the connectors that link the upper and middle boards to

the power supply board (the one that hides the speaker) --- don't
forget to take note of which connector goes where !!!

- Now take a look at the lower board. It looks like this :

(X) green led



- Solder a piece of wire (wrapping wire is a good candidate)
between points (A) and (B).
- Reconnect ALL wires (solder unsoldered wires and connect dis-
connected ones)
- Place batteries back
- Turn unit on : the display should be blank.
- Now type the following :

BANK
1 PROG 8 LIMIT 49.995 SEARCH 561.225 ENTER
2 PROG 50 LIMIT 107.995 SEARCH 561.225 ENTER
3 PROG 108 LIMIT 169.995 SEARCH 561.225 ENTER
4 PROG 170 LIMIT 296.995 SEARCH 561.225 ENTER
5 PROG 297 LIMIT 600 SEARCH 251.575 ENTER
6 PROG 805 LIMIT 1109995 [down arrow] 251.575 ENTER
7 PROG 1110 LIMIT 1300 [down arrow] 561.225 ENTER

- Turn unit off
- Unsolder the piece of wrapping wire
- Mount the unit back (wires, connectors, screws...)

- Turn unit on : it should be working !!!

* My comments :

DO NOT TRY THIS BY YOURSELF IF YOU DON'T FEEL CONFIDENT ABOUT
USING A SOLDERING IRON ON SUCH A MINIATURIZED DEVICE !!!

DON'T FORGET THAT, IF YOU FAIL, THE WARRANTY WILL BE VOID !!!

Now, let's relax. From the programming procedure, it is obvious
that you enter 7 sub-bands in the unit :

8 to 49.995 MHz
50 to 107.995 MHz
108 to 169.995 MHz
170 to 296.995 MHz
297 to 600.000 MHz
805 to 1109.995 MHz
1110 to 1300.000 MHz

These are the values for the AR-1000 as sold in France. The values
may be different for the units sold in Northern America (there may
be other gaps, especially for cellular phone frequencies).

I don't know what the following parameters (561.225 and 251.575)
mean. I guess they indicate which RF subcircuit, which step, and
which modulation mode to use. Anyway, since the sub-bands limits
appear so clearly, it might be fun to experiment. See what I mean ?

But, if we are to experiment, let's make things easier. Instead of
dismounting-soldering-programming-unsoldering-mounting the unit each
time, let's solder a 5" piece of wrapping wire to point (A),
a 5" piece of wrapping wire to point (B). Now we have 2 free ends :
let's solder a microswitch to them. We can glue the microswitch at
the bottom end of the unit, near the power supply board. Resetting
the AR-1000 is now much simpler : just open the unit (4 screws),
flip the switch, turn the unit on, reprogram it, turn it off, flip
the switch back, close the unit.

First of all, if you replace the first "8" with "0.5", you get an
AR-1000 with coverage extended down to 500 kHz. This may not work
on older units. My unit didn't let me program any frequency lower
than 0.5 MHz, or higher than 1300 MHz. Anyway, my aim was to try
to get rid of the 600-805 MHz gap. I tried the following sub-bands :

0.5 - 29.995
30.0 - 219.995
220.0 - 409.995
410.0 - 599.995
600.0 - 904.995
905.0 - 1209.995

1210.0 - 1300.000

To choose these values, I made the following assumptions : the
original values never exceed a 190 MHz span for the "561.225" series,
and never exceed a 304.995 MHz for the "251.575" series. I was careful
not to exceed these ranges, because of the necessarily limited span
of the internal VFO.

These values did seem to work, since I was able to hear some TV signals
near 620 MHz, that is, in the previous gap ! However, when I programmed
some search banks, it sometimes refused to search, even on "authorized"
frequencies (around 450 MHz). And, since there is nothing but TV
channels between 600 and 805 MHz (at least in France), I restored the
original values (except for the 0.5 MHz lower limit).

Now, if you find something interesting, please keep me informed !

As quoted from <20001@crdgw1.crd.ge.com> by gaus@islandgirl.crd.ge.com (Rick Gaus):
+---------------
| I am wondering what are the feelings of others about CW stations
| calling phone special event stations when there is no CW activity for
| the station. Thanks for your replies.
+---------------

Bob Liddy, K8BL, would have *loved* it if you'd done that to the WINO special event station. :-) Unfortunately, we didn't have any keys with us....

If I had a key with me and I were running the station, I'd probably respond. You'd have a better chance if there wasn't much SSB activity at the time, since the CW ops are probably less likely to be operating an SSB station.

From: allbery@NCoast.ORG
Message-ID: <1991Jun4.004315.10557@NCoast.ORG>
Source record: 296180

As quoted from <237382@LNCC.BITNET> by USERFRFA%LNCC.BITNET@cunyvm.cuny.edu (FRANCISCO ROGERIO FONTENELE ARAGAO):

```
+---------------
| The situation here in South America is also very bad. The CB stations with
| powerful KW amplifier and beams use the 10 meters band until 28.3 MHz. I
| think occurs in other countries of the continent such thing as a known
| manufacturer of equipment here makes 500 W and 1 Kw linear amplifier exclusive
| for CBs. In Argentina some cab and delivery companies use the frequencies
| between 29.3 and 29.7 MHz. They cover all sattelite and repeat sub-band.
| Since they use AM the repeater in USA and Europe suffer likely very much
| from such emmited carrier. Here in Bazil there was a net of official atations
+---------------
```

Believe me, we know. OH BOY, do we know. :-(

I'm not sure there are any legal recourses, or even legal solutions. As time passes and this continues, the idea of a legal-limit packet or AMTOR station on top of the offenders sounds better and better... which is an indication of how bad things are.

Source record: 296182

In article <1991Jun3.060143.1760@midway.uchicago.edu> gary@ellis.uchicago.edu (gary buchholz) writes:
>1. Hmmmm... My ICOM 24AT, TS-950 and PRO2006 all have "CPUs" that
> control the radio. ... These are not common CPUs that one might
> find in a computer. Exactly how are these CPU (micro processors)
> in radios and scanners UNLIKE traditional CPUs found in computers ?

They're the same sort of CPU that you would have in your handheld
game, watch, microwave oven. All the necessary I/O ports and
program RAM and ROM built in. Including the program written by
the radio manufacturer. Unless there is an external PROM, you'd
need to get fancy to reprogram one. Something like 1) getting the
development version of the same chip and building a daughter
board, 2) getting the EPROM version of the same chip or 3) buying
a couple of thousand copies with your own ROM programming.

>3. Are the instruction sets for these CPUs readily available?

Some are. Some Mitsubishi chips are 6502's, Some Hitachi chips
are 6805 family, and some of the NEC chips are really extreme variants of
the 8080. Then there's the ubiquitous 8051 (yuck).
Get the data book for the chip maker. The IC Master data guide would
be a good place to look first.

> Are these
> CPUs in radios custom chips or chosen from a "standard" set of such
> CPUs.

Yes and No, it's up to the design engineer(s).

> How about the possibility of reading a radios program ROM,
> dis-assembling the program at the instruction level, modifying it
> and blasting this into an EPROM.

Well, I did this to my printer and somebody posted an article about
reprogramming a Cellular Phone a year or two back.
But if it's a real single chip computer, you'll
need a scanning electron microscope to read the ROM.

NEWS RELEASE

For immediate distribution

The Antietam Radio Association of Hagerstown, Maryland, W3CWC, will present the 1991 Maryland-DC QSO Party this summer. The contest will run from 1600 UTC August 17 to 0400 UTC August 18 _AND_ from 1600 UTC to 2359 UTC August 18.

[In other words, the contest will run from 1600 UTC August 17 to 2359 UTC August 18 with a 12 hour break from 0400 UTC to 1600 UTC August 18.]

MODES : PHONE AND CW/RTTY/DIGITAL

* Stations may be worked _ONCE_ per band using each mode.
* CW contacts may only be claimed if the QSOs was in the CW portion of the band.
* Non-Maryland/DC stations may only claim Maryland/DC contacts for scoring.
* Maryland/DC stations may work any other amateur station.

Portable and mobile stations that change Maryland counties [or states] during the contest count as a separate station in each new county [or state] of operation. Contacts through a repeater do _NOT_ count for scoring purposes. [Repeaters may be used to set up skeds with other stations, however.] All other HF/VHF/UHF contacts do count.

EXCHANGE: Signal Report, QTH _AND_ the MAJOR CATEGORY OF ENTRY.

* Signal reports should be in the standard "RST" format.
* QTH for Maryland/DC stations is either the Maryland county, "DC" for Washington, DC or "Baltimore City" for Baltimore City.
* QTH for non-Maryland/DC stations is either the US state or country of operation, if DX.
* Major Categories are: CLUB, QRP, MOBILE, NOVICE, TECHNICIAN, YL (XYL) AND STANDARD (for all others).
* Use only the one major category for your station.

SUGGESTED
FREQUENCIES:
* SSB: 1.860, 3.920, 7.265, 14.280, 21.370, 50.150 and 144.550 MHz.
* CW: 3.643, 7.060, 14.040, 21.115, 28.060 MHz. Suggested CW listening times are on the odd half-hour, i.e., 1730, 1930, 2130, etc.

SCORING: QSO POINTS
---
* Each simplex phone QSO counts as one point.
* Each simplex CW QSO (including RTTY/digital) counts as two points.
* For Maryland/DC stations, each QSO with a mobile station counts as five points.
* Each QSO with a club station counts as 10 points.

N.B. The highest point value applies, e.g., a CW/mobile contact counts as five points or a CW/club contact counts as 10 points.

MULTIPLIERS
---
* Multipliers may only be counted once; _NOT_ once for each band.
* For non-Maryland/DC stations, each Maryland county, Baltimore City and Washington, DC are multipliers. -- N.B. maximum 25.
* For Maryland/DC stations, multipliers are: Maryland counties, Baltimore City, the District of Columbia, each of the 49 other US states and one for DX -- N.B. maximum 75.

BONUS POINTS
---
* Mobile stations may ADD 100 bonus points to their raw score for each Maryland county/Baltimore City/DC they work outside their home locations from which 20 contacts were made.

FINAL SCORE:
* QSO Points X Multipliers + Bonus Points = Claimed Score

AWARDS:
* High score verified for each US state, Canada or DX;
* Top three Maryland logs;
* High scoring Maryland/DC club;
* High scoring Maryland YL (XYL);
* High scoring Novice;
* High scoring Technician.

CERTIFICATES:
* For each station with at least 100 QSO points;
* To the best SWL log (N.B. Must not be a licensed amateur radio operator.);
* For the highest scoring QRP station.

The decision of the judges is final.

The committee reserves the right to issue additional awards and/or certificates if deemed appropriate by the Antietam Radio Association.

Logs should be postmarked no later than September 10, 1991 and mailed to:

Antietam Radio Association
P. O. Box 52

Hagerstown, MD 21740
USA

Attn: MD/DC QSO Party Contest Committee (Log Enclosed)

Logs postmarked later than September 10, 1991 will _NOT_ be processed.

Be sure your log indicates your complete exchange information and your major category of entry, i.e., CLUB, NOVICE, MOBILE, QRP, TECHNICIAN, YL or STANDARD.

Any questions may be directed to:

WA3EOP
Contest Chairman MD/DC QSO Party
W. Page Pyne
109 South Artizan Street
Williamsport
Maryland 21795
USA

If you would like a complete listing of the results of the contest, send an SASE to the MD/DC QSO Party Contest Committee at the Antietam Radio Association address above.

62. Using telephone PCM chips to mix/route repeater audio

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 03:04:21 UTC
From: buaas@trout.nosc.mil
Message-ID: <9106040304.AA08735@trout.nosc.mil>
Source record: 296327

Is anyone out there familiar (at the chip level) with using any of the many telephony PCM digital switching parts to route and mix repeater and link audio? Ideas, application notes, working schematics, advise greatly appreciated.

Thanks in advance, Bob K6KGS 714/962-4010 (landline)
buaas@nosc.mil (email)

63. Re: QRP

Newsgroup: rec.radio.amateur.misc

Message-ID: <91154.152206DAULIE@BANUFS11.BITNET>
Source record: 296183

Yes, there are some tricks of the (QRP) trade. BTW those also apply
for the guy/girl with a 100W TX in conditions where the lowest denominator
is KW.

1.listen carefully:
How does the other side operate: does he listen up or down frequency (some pr
efer high tones, other low tones). If the other side uses a sharp filter this
can give you an advantage. Does he use full break in or not: when does he pick
out a calling station? Is there some delay? Time your call accordingly.
Let the KW's fight the first seconds, you're no match anyway. Moreover
the other side might not pick-up enough of a call to make a decision...
that's your opportunity.

2.Arouse interest/curiosity:
When calling indicate QRP. Go slower (preferred as he/she will already have
a hell of a time copying you from under the KW's) or faster than the
average callers: it will be different from the others. Same reason why
you could make your call shorter (hmmm sometimes quite difficult) or longer
than the average. (note: call = call up sequence, you know the classical
3 x 3).

3.Do not waste time with calling CQ yourself on a lively band except maybe
on the qrp frequencies.

4.Do not stress your luck. Be concise in your transmissions and let the
other side ask for more information if he/she wants so.
Do not start a 4 hour monoloque (your power won't heat the athmosphere though,
but you won't be able to write the qsl card... :-))

5.Do not immediately try to go for those once in a lifetime dx stations.
Know the stations in your vicinity. Watch for the contacts made by your
neighbour KW, then your neighbour half KW, next the one's with 200 to 100 W,
and then it is the time for you to step in. Be however alert for that
lapse of time that sometimes occurs when everybody thinks everybody is
calling and consequently nobody is really active. You'll amaze your local
big shots - they'll never-never believe you really are qrp...

6.Use the neighbouring stations (with their consent of course) as a
starting platform to have your signal sorted out by the other side. Meaning
that you start with a local qso and then use the opportunity to make it
a three way qso. This will give you a feeling how to operate your station
so that the distant side can read you 'loud and clear'. Be aware however
for the fact that the distant side will not want to offend you.
Be sceptical about his 599||| (even if 559). Watch for silence after your
over (he might have lost you in the qrm, but on the other hand he/she
might not even have heard you). Do not be offended, it's your problem,

not his/hers.

5.have patience
QRP is certainly not the game if you want all awards made within a week...

Well, that are the tricks I used (not very active nowadays, but just wait...) while working 100W to 1W. There are certainly quite a lot more (let us hear them...).

Have fun qrp'ing...

Mike
ON6ML

* *
Whatever dx I might have worked, what I still remember most lively is the ON to W qso made with 1 W this side (output level way down) and 1 milliwatt on the W side.

64. SIGNIFICANT SOLAR FLARE ALERT - 04 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 07:44:18 UTC
From: oler@HG.ULeth.CA
Message-ID: <910604014418.21c01926@HG.ULeth.CA>
Source record: 296187

-- MAJOR SOLAR FLARE ALERT --

JUNE 04, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

Region 6659 remains a very potent spot complex. This region exploded with another very powerful solar flare. This flare, like the previous event at 15:20 UT on 01 June, was rated at greater than class X12 and was associated with an optical 3B classification (very large and brilliant). This event was associated with moderately strong radio bursts. The 1695 MHz burst was 11,000 s.f.u. while the 245 MHz burst was 28,000 s.f.u.. There currently isn't any data available regarding possible sweeps from this event, although a Type IV may have occurred (intensity unknown). The integrated x-ray flux on this event was very high, estimated at 3.47 joules per square meter. The event began at 03:43 UT on 04 June, peaked at 03:43 UT on 04 June and ended at 06:07 UT on 04 June. The x-ray levels erupted from a class C1.7 level to the greater than class X12 level (a massive increase) in under 8 minutes. The location of this powerful event was N30E65. This is a significant solar flare.

Another major HF radio blackout has occurred with this event. Data across the sunlit hemisphere registered blackout or near blackout HF conditions. Signals are beginning to fade back in, although absorption levels will likely remain enhanced for several more hours.

Region 6659 has rotated into better view now and appears as a relatively large beta-delta group covering over 2,800 million square kilometers. This region was unusually quiet over the past 24 hours, only managing to produce a minor C-class flare prior to todays major X12+/3B Flare. GOES sensors were once again saturated during this event. The actual x-ray intensities which were achieved is not known.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

This flare could have a low to moderate terrestrial impact, according to the models. The models suggest a high probability (90%) of a sudden magnetic impulse followed by minor geomagnetic storming. However, we believe this prediction is too severe. We are predicting a possible SSC with active geomagnetic conditions (and a slight possibility for some geomagnetic storming). However, there is an equally high probability that no impact will be observed from this event at all. Additional analysis will be

required, which may be dependent on whether we intercept any protons from this event.

There is a small risk for proton activity from this last flare, although we believe protons probably will not be observed here at the Earth despite the fact that copious amounts of protons were likely ejected from this flare (the flare-Earth proton trajectory is not favorable at this time). Nevertheless, warnings are being maintained for possible future proton and PCA activity. HF and navigational operators are warned to be aware of the increased threat which exists this week for polar and high-latitude related proton disturbances. There is a moderately high probability for satellite proton and PCA activity this week (approximately 50%), dependent on whether Region 6659 remains capable of producing major flares.

Region 6659 (which is now located at N31E66) is expected to continue to produce major solar flares over the next week. Another flare in the X-class range may not be observed for another 48 to 72 hours, although major M-class flares are possible at any time.

HF radio communicators are warned of a relatively high risk (65%) for further major (possibly long-duration) HF radio blackouts in the coming days. Daytime fading caused by minor and possibly major M-class flaring is also a distinct possibility.

If Region 6659 continues to produce these very powerful solar flares over the next week to 10 days, a high risk will exist for strong terrestrial impacts (ex. major geomagnetic and auroral storming, possibly combined with potentially strong proton activity). This is, of course, entirely dependent on whether Region 6659 continues to remain flare productive. At the present time, we see no signs of decay. Projections are uncertain, although we believe the risk for continued major flaring from this region is sufficient to warrant future precautions.

Watch for future major flare alerts and possible terrestrial impact warnings.

|>

What hams do you want to listen to? The scanner is best for UHF/VHF FM stuff. But unless it's an unusual scanner, it won't be too hot for CW, SSB, satellites, EME, etc. The shortwave will be best for HF with a lot of caveats. (Like hams mostly use SSB for voice. You may have a hard time tuning CW. You may have a harder time decoding RTTY, FAX or SSTV.)

66. CB to 10m conversion

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 13:45:09 UTC
From: vbreault@rinhp825.gmr.com
Message-ID: <55050@rphroy.UUCP>
Source record: 296188

Dear net Elmers,
Can you tell me what is involved in converting a Midland mobile/base CB
for 10 meter use? Is it possible? Is it worth it?

Yes, I'm the one that started a rucus a couple weeks ago by buying plug
and play equipment for my introduction to ham radio. I'm happy to have
the new stuff and use it daily. Now that I have a shack started, I'd like
to spend some time on hardware work without worrying that a screw up
will take me off the air entirely.

advTHANKSance (thanks in advance)

Val Breault - vbreault@gmr.com

68. 10 meter summer vacation

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 14:10:03 UTC
From: n2ic@cbnewsb.cb.att.com
Message-ID: <1991Jun4.141003.29808@cbfsb.att.com>
Source record: 296229

For several years, I have been searching for a plausible explanation as to why the F2 layer MUF drops during the summertime. The best explanation was from Ken Davies. Ken Davies is an ionospheric physicist at the Space Environment Lab in Boulder, Colorado (the folks who put out the flux, A-index and K-index numbers). He has written several books on the subject. His most recent book is "Ionospheric Radio", (1989, Peter Peregrinus Ltd., London, publisher). The book says

"Although during January the Sun is at a low elevation compared with June, the January noon F2 layer critical frequency is more than twice the summer value. This implies a peak electron density ratio of more than 4 to 1. Notice that this 'winter anomaly' occurs in the daytime only; it is thought to be due to a large summer electron loss rate caused by an increase in the molecular-to-atomic composition of the neutral atmosphere."

At a meeting of the Mile Hi DX Association several years ago, I asked Ken about this. My recollection is that he said that it's really a chemistry problem, not physics. The intense solar radiation during the summer causes the lower layers of the ionosphere to greatly heat up. This causes turbulence which forces neutral atoms into the F2 layer, thus reducing the electron density and lowering the MUF.

After reading Ken's book, and several others on ionospheric physics, I get the distinct impression that the lowered summertime MUF is not an "interesting" problem for an ionospheric physicist. They are more interested in things like magnetic storms.

Disclaimer: One of the other books that I read had a completely different explanation from the one presented by Ken Davies.

69. 10 meter observations

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 14:28:39 UTC
From: n2ic@cbnewsb.cb.att.com
Message-ID: <1991Jun4.142839.254@cbfsb.att.com>
Source record: 296230

I have had a great interest in 10 meters for many years. For what it is worth, here are my observations about summer time propagation.

During May, June and July, 10 meters sounds deceptively good, due to the presence of Sporadic-E propagation. Sporadic-E not only allows great communication at distances of 500 to 1500 miles, but also often provides a way to get your signal to an area that has F2 layer propagtion. For example, often times, late at night (i.e. 11 PM local time), we will have Sporadic-E propagation to California (from here in Colorado), From Calif., there is often F2 layer propagation to Australia and New Zealand. Therefore, for us to work VK/ZL, we have a coupling of Sporadic-E to F layer propagation. Without the Sporadic-E coupling, we rarely have F2 layer openings from Colorado. The more southerly USA stations (i.e. Texas, Florida, southern Ca.) often have F layer openings that we do not get.

During days with abnormally quiet magnetic fields (i.e. A index < 5), 10 meters does open for F layer propagation, even on northerly paths (i.e. Europe).
However, even on those "good" days, 10 meters opens "late" compared to winter time. During winter, 10 meters opens at sunrise. During summer, if 10 meters does open, it will be 3 or 4 hours after sunrise.

Steve London, N2IC/0

70. Re: Need club station address

71. Antenna Gain Question

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 15:26:33 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <6745@vela.acs.oakland.edu>
Source record: 296191

I have a question about antenna gain. The questions is, what is antenna gain defined as? If I have an antenna with a gain of 3db, that means that it is 3db times better than what? Also, what kind of gain does a 1/4 and 1/2 wave antenna have? Is there anyway of calculating gain, or does it have to be measured?

thanks,

Steven D. Kuo N8OPH

Radio License, or the like.

Contact the ARRL. They have all the information on reciprocal licensing.

The Mexico process is fairly simple and quick. I haven't done it personally
but have a sister and brother-in-law there there who have done so. You go to
the local agency (PTT, I think), fill out the application, show your US Amateur
license, pay the fee and get your license. If you are going to the LA Paz
area, you can do it there - my sister just did.

From: albers@ka3ovk
Message-ID: <1991Jun04.153913.9486@ka3ovk>
Source record: 296205

Wow. I was on last (Monday) night at midnight, running about 10 Watts into an attic dipole, talking to a friend of mine a few miles away when a station in Macon, Missouri call in. He was weak and with heavy sharp fading, so I cranked up the power to 100 Watts, and we chatted with him. A few minutes into the QSO, 2 station from Nebrasaka broke in a joined us, and we all talked for a half an hour or so. Before we signed off, a station joined us from Minnisota! It was 2:30 AM EDT by the time we all signed!

Signals were S0-S7 with heavy fading, but the noise level was so low there was no problems! I guess that was E-skip? Neat stuff -- I wish I had my 2m SSB station back up again!

74. Re: Antenna Gain Question

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 16:03:30 UTC
From: dlp@zule.EBay.Sun.COM
Message-ID: <6998@male.EBay.Sun.COM>
Source record: 296196

In article <6745@vela.acs.oakland.edu>, sdkuo@argo.acs.oakland.edu (Steve Kuo) writes:
|> I have a question about antenna gain. The questions is, what is antenna
|> gain defined as? If I have an antenna with a gain of 3db, that means
|> that it is 3db times better than what?
Gain is defined in terms of a half-wave antenna in free space. This
is a completely hypothetical situation that never occurs, but if you
could construct a half-wave antenna at sufficient height to avoid
the effects of ground you would have a reference antenna.

|> Also, what kind of gain does a
|> 1/4 and 1/2 wave antenna have?
It is a little harder than that. A half-wave dipole obviously has very
close to 0 gain. But a 1/2 wave Yagi can generate a lot of gain. A
1/4 wave antenna will be close to 0 gain, if you have a good ground
system because the ground provides the other image half to create
a 1/2 wave antenna.

|>Is there anyway of calculating gain, or
|> does it have to be measured?
|>
Probably, but computing thereotical gain referenced to a thereotical
antenna isn't as interesting as making contacts.:-) Seriously, the
gain can be computed, but like all antenna calculations and simulations
it would only be a reasonable approximation. Your mileage would vary.:-)

Hope this helps.

From: charlier@hplsla.HP.COM
Message-ID: <20360018@hplsla.HP.COM>
Source record: 296216

I've had a request to post an explaination of the measurements posted
in my list of HF rig measurements. Not everyone has 20 years of QST's
in their garage, it seems! ;-)

Here's a quick and dirty overview:

Minimum Discernable Signal. (MDS), (Min Sig on my chart). The more
negative, the better, although below a certain point, it doesn't
matter. The signal level, which when fed into the receiver at its
tuned frequency, causes the signal at the speaker to double in
power.

Receiver Blocking Dynamic Range: The more dB, the better. Measures
how easily the reciever is overloaded by signals not in the passband.
We listen to a weak signal, and gradually increase the level of a
strong signal 20kHz away, until the weak signal drops in strength by
1 dB at the speaker terminals.

Intermodulation Distortion Dynamic Range: (IMD DR) The more dB, the better.
2 strong signals fed into a receiver will generate other frequencies
(i.e. Third order products). This tells how far above the MDS those
signals have to be to create an audible third order response.

Third order intercept. The larger,(more positive) the better.
Another indication of the IMD. This number is calculated from the
MDS and the IMD DR. (MDS + 1.5*IMDDR). As you increase the level
of the 2 strong signals, the 3rd order responses (at 2*f1 - f2 and
2*f2 - f1) increase in strength 3 times as fast. This is the input
level where they would be equal, i.e. intercept, if this linear
behaviour extended that far. Usually, the mixer in the reciever is
overloaded by that point.

What are good numbers? What are bad numbers? Well it depends.
As the old saw goes: "You pay for what you get, but you don't always
get what you pay for". A perusal of the chart shows that the numbers
are getting better and better as new rigs come out. But if you have
a limited budget, and you are a casual operator (i.e. not trying to
make the DXCC honor roll, or win DX contests), a rig with somewhat
lower specs may be ok. About the only place where I might put a
"good enough" limit, is in the area of MDS. Even on 10 meters, there
is a certain level of atmospheric noise that will make a -145dBm MDS
unneeded. I was quite happy with my relatively "deaf" SB-100 for
many years, with its MDS of -131 dBm.

My purpose in publishing these numbers is to help the person who
is faced with a choice of, say, 2 radios of similar price, but not

sure which is better in the specs department.

One final note. It has been pointed out to me that the MDS number In my list for the FT-102 is actually a 'preamp-off' number. For some reason that is the only number published in the review. With its preamp on, therefore, the MDS is actually quite lower.

76. Alinco Radio Repair Service

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 17:06:57 UTC
From: TSDIMO%GOR1@leav-emh.army.mil
Message-ID: <9106041707.AA28730@ucsd.edu>
Source record: 296197

I see a lot of folks talking about how they like their Alinco radios. I've had a DR-110T for about a year now. About six months ago one of the lights on the frequency readout burned out, leaving onlyone. Now the other one goes out from time to time, leaving me with a blank freq display. I bang on it and it comes back on for a while. The radio works other that this. I am gonna have to send it to Alinco to replace the display lights, since they are soldered behind the display module. Any body with any experience on how quick Alinco turns around equipment? They don't answer the phone.

I am looking for mods to the kenwood th-77a handheld.
I have looked on 129.100.22.100, and didnt seem to find any...
Any other suggestions??
There are two mods in particular: one is the cross-band repeat mod, and the other
is the extended rx mod.
Any help is appreciated...

78. SCPC & the FCC (Single Channel Per Carrier)

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 17:28:46 UTC
From: gingell@aurw90.UUCP
Message-ID: <9106041728.AA21759@aurw90.local>
Source record: 296200

I am interested in building a database of information as to what SCPC channels are available on TV satellites, what modes they use frequencies, bandwidths, deviation, companding etc. This is for personal use and just because I am interested.

From what I see the FCC controls most aspects of the domestic use of Satellites. Such things as frequency allocations, permitted types of transmissions, even the location of satellites. Recently operators were forced to add Morse Code Identification as an additional audio subcarrier to TV transmissions by satellite.

My question is this. Is the allocation and use of frequencies a matter of public record at the FCC. In other words if I want to find out who uses what and in what modes because I am interested in say, SCPC, can I under some rule or other (freedom of information act?) request this data and have them provide it to me at no or nominal cost?.

]does it have to be measured?
I don't remember if antenna gain figures include losses or not, but
in general it makes little difference. The gain is that increase in
signal measured (at a distance) in the direction of maximum directivity.
It is relative to either a dipole (in which case the gain is expressed
as dBd) or isotropic (dBi). Isotropic means that the signal is distributed
evenly across the surface of a sphere with the antenna at the center.

>|> that it is 3db times better than what?
>Gain is defined in terms of a half-wave antenna in free space.

Generally. If you see gain specified as "3dBd", then it is definitely
"3dB compared with a free-space dipole". Sometimes you'll see gain specified
as "3dBi", which is "3dB compared with a free-space isotropic radiator" (good
luck building one). A (free-space) dipole is 3dBi in the preferred direction
(broadside to the radiator). (And Maxwell only knows what that kinked dipole
in your backyard, 10' above the dirt, is... :-)

If you see gain specified as just "xx dB" and it seems about 3dB too good to
be true, it's probably dBi being used to inflate the number. If it is "xx dBd"
and seems too good to be true, then they're probably lieing to you :-).

85. Re: Ramsey 2m Xcvr Kit?

>
>Any comments appreciated.

I'm building one now. I've completed all but the PA and the final integration into the cabinet. I was only missing three parts, all capacitors. The kit goes together well, but I question some of the assembly order in the manual. I've found that it's generally easiest to stuff low profile parts first followed by the taller items. The manual often instructs you to put the big stuff in first leaving little room for fat fingers to insert the smaller parts. I decided to strictly follow the procedures in the manual though on the off chance they had a reason for their assembly order. The radio is constructed in sections to allow step by step testing. The audio section is first, worked first time. The IF section follows, worked too. The synthesiser is built next. Then the other oscillators are assembled, worked first time. Then the RF frontend is assembled, worked. Then the microphone amp, modulator, driver, and PA. I have a working receiver now though I haven't done alignment yet. Soon as the PA is finished I'll do tuneup and post some specs.

One glaring fault is that the power connector hole in the cabinet backpanel doesn't come close to lining up with the power jack on the circuit board. A few minutes with a nibbler fixed that, but boy is it ugly. It missed by 3/4 inch. Also, actually measure the wires used to connect the front panel controls to the circuit board. The lengths in the manual are too short. If this thing tunes up with good specs, it's a real winner because it's as good a kit as you can expect, even from Heath. The manual is clear with step by step check off instructions, there is a big schematic, and an even bigger x-ray view of the board. The cabinet is sold separately and there are no assembly pictures in the manual, but it can only go together one way so you can't go wrong. One interesting note, on the cabinet backpanel it says that it is the cabinet for the 144,220,440 radios. More to come.

86. re:Antenna Gain Question Steven D. Kuo N8OPH

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 20:40:49 UTC
From: Wayne_A_Lightsey.Roch809_XBS@xerox.com
Message-ID: <".4-Jun-91.16:40:49.EDT".*.Wayne_A_Lightsey.Roch809_XBS@Xerox.com>
Source record: 296203

There are two conventional references when referring to antenna gain: dbi and dbd. A gain of "3db" without knowing whether it references an isotropic radiator (dbi) or dipole (dbd) can be quite misleading. dbi is gain referenced to an "isotropic radiator" - a theoritical point-in-space antenna around which the radiation pattern is uniform (spherical). The isotropic radiator has no gain. dbd is gain reference a dipole antenna in free space. A dipole antennas major radiation lobes are perpendicular to the plane of the antenna and a dipole has 2.2 dbi gain! This gain is accomplished by the radiation being perpendicular to the antenna and none occurring off the ends of the dipole. I.E. you don't get something for nothing, you just rearrange the energy. Therefore, your 3db gain antenna could be 5.5 dbi (i.e. 3 dbd is the spec.) or it could be .8 dbd (i.e. 3 dbi is the spec.) ARRL quit accepting gain claims in ads in QST from antenna manufacturers due to inconsistency and confusion over this one relatively simple issue. Don't guess, ask. The unit "db" has little absolute meaning - you must have a reference to go with it to know what it means.

Practical antennas have to take into account proximity to ground, the relative conductivity of the ground (even if it is water), nearby objects, etc., etc., etc.

Gain can be both calculated and measured. Popular computer programs are MININEC and/or ELNEC, both of which run on IBM-PC compatible devices. These programs are user friendly enhanced versions of a public domain program developed by the Navy (the name of which escapes me at the moment) and have proven to be more than accurate enough for terrestial work. There are specialized versions available just for Yagi-Uda arrays also. It is possible to do the same thing with hand calculations but far to tedious and time consuming for the average person to endure.

Antenna gain measurements, to be accurate, require a carefully designed antenna range. Gross approximations can be made by driving (or flying if so inclined and equipped) around the antenna, beyond the near field, and taking relative signal strength measurements.

Good luck, Wayne KB6CSP

It looks like TLPS batches their junque mail.
Test to license time: 6 weeks
License to TLPS time: 4 weeks

BTW: If you live in an interesting place, consider having someone print some cards for you. Get a stack of local interest cards (the kind of stuff you'll find in an airport gift shop) and have a printer put the QSL stuff across the front or back. Alternatly, use an indellable (sp?) felt marker to make your own. (This idea is not my own.)

TLPS has some interesting stuff, but hardly unique. I'm considering going the local interest card route myself. After pricing it out, I may be seen sending TLPS a check though.... :-)

88. MINOR TO MAJOR GEOMAGNETIC STORM ALERT - 04 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 21:26:14 UTC
From: oler@HG.ULeth.CA
Message-ID: <910604152614.21c01adf@HG.ULeth.CA>
Source record: 296214

/\

GEOMAGNETIC STORM ALERT

/\

Issued: 18:00 UT, 04 June

Minor to Major Geomagnetic Storm Alert

ATTENTION:

A minor to major geomagnetic storm began at approximately 16:00 UT on 04 June. The source of this storming is not entirely certain, but could be related to a long-duration minor M-class flare several days ago.

Major storming is occurring over the high latitude and middle latitude regions. Storming is expected to increase in intensity during the local evening and early morning hours of 04/05 June, which may allow low latitudes to spot auroral activity. A Low Latitude Auroral Activity Warning has been issued for the low latitudes. Conditions could become favorable for low latitude auroral observations. Lunar phase will not be a factor until the local early morning hours.

Geomagnetic storming is expected to continue for the next 24 hours. Major flaring from Region 6659 could contribute additional storm activity by 06 June.

A proton event is also in progress. More details will become available over the next 24 hours.

A high risk PCA warning exists for the polar and high latitude regions. Long-duration HF radio blackouts may become possible over portions of the high latitude and polar regions. As Region 6659 continues to spew out powerful solar explosions, the intensity of the proton and possible PCA activity could increase. Region 6659 is not yet in a particularly favorable position for producing strong terrestrial impacts. However, the power of the flares from this region will be sufficient to begin producing moderate to high terrestrial impacts after 06 June. We are projecting continued major solar flaring from this region for the next 5 to 7 days, and possibly longer.

High terrestrial impacts (major to severe geomagnetic storming, strong PCA and proton activity, and continuing major ionospheric disruptions) are a strong possibility over the coming week.

We will begin issuing daily solar terrestrial event updates at this time. This is a high-risk period.

** End of Alert **

89. LOW LATITUDE AURORAL ACTIVITY WARNING

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-04 22:01:22 UTC
From: oler@HG.ULeth.CA
Message-ID: <910604160122.21c01aae@HG.ULeth.CA>
Source record: 296209

/\

LOW LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 04 JUNE, 1991
VALID: 04 - 05 JUNE

/\

ATTENTION:

A minor to major geomagnetic storm is presently in progress. Conditions could become favorable for low-latitude auroral activity observations during the local evening hours of 04 and 05 June. Lunar phase will not be a source of interference until the early morning hours. Dark skies are expected until the moon rises, and should provide optimum conditions for observing auroral activity.

Please note that as Region 6659 continues to produce very powerful major flares, and as it continues to rotate into a more sensitive and influential position, auroral and geomagnetic storming could become very high later this week and into next week. There is a distinct risk for low latitude auroral activity becoming visible over the low latitude zones, as far south as Florida and southern Texas sometime during the next 7 to 10 days. For the southern hemisphere observers, auroral activity could become very visible throughout all of New Zealand and Australia.

Daily solar terrestrial event updates will be presented effective immediately.

** End of Watch **

> Gain is defined in terms of a half-wave antenna in free space. This
> is a completely hypothetical situation that never occurs, but if you
> could construct a half-wave antenna at sufficient height to avoid
> the effects of ground you would have a reference antenna.

(Stuff deleted)

Antenna gain is commonly referenced to either one of two points. (There are others that are less often used). These are the isotropic or point source antenna and the half wave dipole. The figures are usually expressed as dbi or dbd to differentiate between the reference source.

An isotropic antenna theoretically has a gain of one while a half wave dipole in free space has a gain of 2.2dbi (approx).

The gain of the same antenna may be readily given with two gain figures that are 2.2db different. The reason for this is that a dipole has gain over an istropic is due to the "donut" torus shaped radiation pattern.

It is the change in the radiation pattern or directivity that gives an antenna gain. This works by concentrating the radiated energy more in the desired direction and eliminating radiated energy in unwanted directions.

Most antennas are reciprocal devices, that is they will perform the same whether they are radiating or receiving energy.

Hope this hepls.

You should know better than to start things like this but.....

ANTENNAS DON'T HAVE GAIN!

However, since we need a way to relate, usually the 'referenced to
a half wave dipole in free space' is left off and 'gain' or 'loss'
is stated in decibels. Keep in mind that the same power is radiated
so to get more in one direction you must have less in another. There
are some rules-of-thumb about the maximum 'gain' you can get with a
given number of elements and there are ways to calculate theoretical
'gain' but it's best to learn the principles of antennas and the
methods of testing and adjusting to get the best results.

W2SZ (/1) will be operating in the ARRL VHF/UHF contest this weekend
from Mount Greylock Massachusetts in gridsquare FN32.

Our Longitude and Latitude is West 73.1667degrees North 42.6364degrees
note that they are in decimals of degrees not deg-minute-second format!

We will be operating 6meters through 24Ghz. On 6-1296 we can run
SSB/CW/FM. On 2,3 & 5 Ghz we have narrowband capability only (read no FM)
On 24 Ghz, we have FM only. However on 10 Ghz we have both an FM station and
SSB/CW... we have a big TWT on 10gig into a fairly large dish.. please sked
with us for microwaves by contacting us on any of the VHF/UHF bands..
We are especially looking for anyone to work after 0100z both TnightsU.

If you need FN32 (and even if you do not) please give us a shout. Even if you
are
not serious about contesting or VHF/UHF and up activity, if you have the

capability, just jump on and work any of the fine gridexpeditions and home
stations that will be on this coming weekend. I know that the VHF+ ops
will agree that it is a lot of fun and a good change of pace.

96. Northern California 220 Mhz band plan

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-05 01:31:29 UTC
From: ENGE@almaden.ibm.com
Message-ID: <060491.182114.enge@ibm.com>
Source record: 296217

FYI .. I hadn't seen this posted before.

222.00-222.14 -- EME, SSB, etc
222.14-222.15 -- Guard band
222.15-223.39 -- Repeater inputs
223.39-223.55 -- Simplex
223.55-223.75 -- Packet
223.75-225.00 -- Repeater outputs

All the FM and packet channels are 20 Khz wide on the even multiples.
So 223.56 is a packet channel; 223.76,222.16 is the first repeater
pair, etc.

This plan has been adopted both by the Northern Amateur Relay
Coordination Council (NARCC) and the Northern California Packet
Association (NCPA). Ten repeaters have to move from the seven
repeater pairs that are being switched to weak signal and packet.

97. Antenna Plumbing

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-05 02:43:29 UTC
From: tjsandoz@king.mcs.drexel.EDU
Message-ID: <9106050243.AA23276@mcs.drexel.edu>
Source record: 296219

Folks;

a) Can somebody give me a clue on the wave propagation speed on std. 1/2" copper plumbing pipe? I have some handy, and would like to build a 2m antenna'r. That is, I'm looking for the magic number M, where M/freq gives me the "on the surface of the cu" wavelength. Ergo, I won't spend so much time with a hacksaw trying to get a decent SWR. Cut and paste with 1/2" pipe can't be much fun...

b) On the same note, what's the best _omni-directional_ gain design from about 16 feet of said pipe? Dipoles are DIY easy, but is a j-pole more attractive from a gain standpoint? Set-up: 24at indoors (read:only 5W) and about 35' 9913 term'd with N. Antenna height would be on the order of about 30' above ground. I guess someone really in the know can give me a guesstimate of d(added_height)/d(antenna_gain). i.e. x feet more height gives about the same as y dB's more gain.

c) To further complicate things, the ideal situation would be a 2m/70cm antenna'r. Anyone built up the design in the Handbook? How copy?
Any other "dual" designs/info/tidbits/failure stories much appreciated.

73 & Thanks in advance, Jim n2mpt

>Well, I did this to my printer and somebody posted an article about
>reprogramming a Cellular Phone a year or two back.
>But if it's a real single chip computer, you'll
>need a scanning electron microscope to read the ROM.

Some radios like my Yaesu 727, my friends 411 and 811 can have some
parameters reprogrammed. The 727 can be done from the keyboard, and
there was an article here a while back about downloading the memory of a
411 into a PC, modifying a few bytes and uploading it back. But major
changes would require a development system and source.

I've often thought that a replacement CPU for a IC-02AT or -04AT with a
few changes would be real popular. Like use the 2nd PTT button for a
"function" key and the 1-2-3 keys for -repeat, spx and +repeat. Or two
taps on the 2nd PTT for monitor the input. Too bad the chips are such

sealed black boxes.

Source record: 296225

/\

GEOMAGNETIC STORM UPDATE

STORM UPGRADED TO MAJOR CATEGORY

/\

07:00 UT, 05 June

STORM UPDATE INFORMATION:

Major to severe geomagnetic storming is currently in progress (07:00 UT, 05 June). Conditions intensified around 05:00 UT and have reached severe storm levels over the middle and high latitudes. Significant geomagnetic and auroral storming are being observed.

There is a high probability for low-latitude auroral observations this evening (04/05 June) and tommorrow evening (05/06 June). Continued major geomagnetic storming could be observed if solar Region 6659 continues to produce strong solar flares. Major flaring is expected to continue.

A polar latitude HF radio blackout has been observed due to intense solar proton bombardments. Absorption over the high latitude and polar regions will remain capable of producing long-duration HF blackouts over the next 24 to 48 hours, at least. Further major flaring could degrade conditions even further.

A significant probability for VHF auroral backscatter exists over the low, middle and high latitude regions. Conditions are very favorable for VHF backscatter communications over widespread areas.

Auroral storming is very high at the present time. This is a very strong geomagnetic and auroral storm.

No significant improvements are anticipated over the next 12 hours. Conditions over the sunlit hemisphere will be less severe than conditions on the nightside.

An update will be posted later this UT day.

101. Memory reset on AR1000?

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-05 11:00:11 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <05.Jun.91.12
Source record: 296226

Hi. Has anyone found how to junk all the contents of all the memories on an AR1000 and set it back to the factory default?
I was 'experimenting' with mine (pressing combinations of buttons to see what might happen) and it now seems to have gone into some incurable curious wedged state of ignoring all the keypad controls. If i disconnect the nicads AND any lithium CPU backup cell, will i clear the memories or will the thing also lose all its 'personality' and just sit there looking dumb?
(i suspect i am about to find out the answer to this question the hard way!)
When i remember what i did to get it 'wedged', i will let you all know so you can avoid doing it to yours....

Why do the manufacturers not fit a concealed 'reset' switch?

Cross-posted to: rec.radio.amateur.misc,sci.geo.geology,comp.graphics,rec.games.programmer

I would like to play around with a couple of different projections. Specifically I would like to create an azimuthal equidistance X-window of the earth from a country outline database. Would anyone have a formula handy for translating lat/long into x/y coordinates?

I'm also trying to create whatever projection you would call "looking at the earth from the moon". I think I can figure this out if I think about it some more, but the azimuthal equidistance projection is beyond me.

Perhaps someone can suggest a reference text on the subject. (Not general computer graphics, but specifically covering the bizarre transformations cartographers use to draw a 3d globe onto a 2d piece of paper).

richv

BTW azimuthal equidistance projections look really weird but are handy in amateur radio to determine which way to point directional antennas.

>
>AL N1AL

The going price for Andrew 7/8 Heliax is $4 at foot and type N connectors
are $80 each. I saw used heliax changing hands at Dayton this year for
half that. The 1/2 inch stuff is usually much cheaper at $2 a foot and
the connectors are $44. I saw one roll at Dayton for $150/100 feet with
N connectors. These rolls were in AS NEW condition. Cable that has been
hung outdoors must be evaluated carefully before purchase. Water ingress
will destroy the low loss characteristic.

Gary KE4ZV

106. 7/8 heliax pricing...?

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-05 12:46:56 UTC

Message-ID: <9106051303.AA29091@ucsd.edu>
Source record: 296228

Hardline prices range from free to exhorbitant. For 7/8",
I wouldn't pay more than $1.00/foot if "used", $1.50/ft if "like-new."
You can often get it for much less. To estimate quality, look at the
color of the copper. If it's green or black, stay away. Only the
outer side of the inner conductor and the inner side of the outer
conductor matter; the rest doesn't participate in RF. If you see
corrosion at an end, don't assume that it extends only a few inches
because it could easily include the entire length. The only way to
tell is to open it up (a one-way process). Even good-looking
hardline can be bogus; I have seen wonderful-looking Andrew Heliax
with loss >10 db/100 ft at 2 meters. That was hard to believe, but
true.

If the stuff comes with connectors, great. However, there is no point
in going to the cost of 100' of 7/8" if it has "UHF" connectors -
type "N" is the only way to go (for 144 MHz & up).
Good, new 1/2" hardline is better than raggety old corroded 7/8".

"Heliax" is a trade name of the Andrew Corp. They
make arguably the best hardline, but others (like Cablewave) make good
stuff too. You GOTTA get the same brand connectors as the hardline
they will be used with. And watch out for mixing types within
a single company - Andrew made spiral-corrugated and concentric-
corrugated varieties (the latter, their LDF-line, is the newest).

I recommend Cablewave Aluminum-jacketed line if you are installing a
permanent line. It's cheaper and works well, plus the connectors
are well made. However, it is not tolerant of frequent flexing. If
you are going to be moving the stuff a lot, you have to go with
copper-jacketed line because it doesn't mind bending. Finally, for
around-the-rotator "tag lines" you should invest in a hunk of Andrew
SuperFlex (or just use RG-8).

Unless you know what you're doing, stay away from "air" line. It
requires pressurized Nitrogen. Old air line, which might be found
surplus, has probably not been continually pressurized and has a
good chance of having been contaminated.

There.

What's in QST this month -- July, 1991

Technical

"Feeding Dipole Antennas"
Last month, I covered dipole-antenna basics. This time I'll show what it takes to get RF from your rig to a dipole--and how to make that antenna radiate as much of your signal as possible.

"A Single-Board, No-Tune 902-MHz Transverter"
Using printed band-pass filters, monolithic microwave integrated circuits and an on-board local oscillator, this inexpensive transverter brings new ease to 33-centimeter operation.

"A Light and Sturdy Quad for 10 and 15 Meters"
Fishin' for DX? A few fishin' poles and a hank of wire can help you snag the Big One!

"Build a Portable Groundplane Antenna"
Need a better antenna for your hand-held radio? Here's the answer.

"An Introduction to Digital Signal Processing"
DSP makes headlines even in an age where digital seems to be applied to just about everything electronic--and now it's part of Amateur Radio. Here's a look at what DSP is and can do.

"A Simple, Effective Dual-Band Inverted-L Antenna"
Classic ham-antenna types are classics for a reason: They've worked predictable and well for several generations of hams. Here's how to put such an antenna--the inverted L--to work on the low bands.

Product Review: "Kenwood TS-850S 160-10 Meter Transceiver"

News and Features

It Seems to Us: "The First Hundred Days"

"STS-37: The Educational SAREX Mission"
The Shuttle Amateur Radio EXperiment (SAREX) made its mark as hams earned a place in the annals of space travel and communications.

"Amateur TV, SAREX and "Real Television""
These radio amateurs succeeded in two major challenges: Being the first hams to send fast-scan amateur television pictures to the space shuttle, and surviving the horde of journalists who came to cover the story.

"Get Out of the Shack and into the Action"
Public service communications is a golden opportunity to demonstrate how ham radio operators can assist their friends and neighbors.

"The Challenge: Getting Ted on 20"
The support of fellow amateurs and sheer force of will helped one determined ham overpower a daunting handicap.

"Hamfest and League Renewal in "YLA-YLZ" -Land"
The "old" Latvia emerges on the bands, and hams from the US and elsewhere share in the celebration.

"The Old Guard"
He's standing firmly on shore these days, but this old salt go his feet wet in radio in the days before organized Amateur Radio.

"If Something Goes Wrong..."
In scenarios that mirror the intensity and drama of actual disasters, hams put their equipment and communications skills to work in the 1990 Simulated Emergency Test.

>levels over the middle and high latitudes. Significant geomagnetic and
>auroral storming are being observed.

A stupendous auroral display was visible from 10 to 12 PM last night
at exactly 40 degrees north latitude near Champaign Illinois. I've never
seen on of these before. It was quite something - we had my scope set up
and could read the setting circles by its light.

Incidentally, what fluorescent species are prevalent in these displays?
We noted that they were dimmed perhaps 95% by both O[III] and H-beta
filters.

In article <6757@vela.acs.oakland.edu>, sdkuo@argo.acs.oakland.edu (Steve Kuo) writes:

|>So then, what kind of vertical antenna (such as one on a car), has
|>gain. How does one make a vertical antenna (non-directional) that is
|>"better" than a 1/2 wave?
|>

The first guiding principle is that there is no magic. "Gain" doesn't mean that an antenna magically amplifies your signal. It means that it focuses the energy into a pattern. If the pattern does not radiate in one direction, then the energy that would have gone in that direction goes in another direction.

The space you have to work with is three-dimensional, so if you imagine an isotropic (point) radiator as having a spherical pattern, then imagine a vertical antenna as squeezing the sphere so it's flat at the top and bottom, that is how you get gain off a vertical.

It looks like an interresting kit but I never heard of it before this article; I have a few basic questions:
1- Is this a base station?
2- Where do you get the kit?
3- What is the app. price?

Regards,
Clem, VE2HQJ

In article <1991Jun3.060143.1760@midway.uchicago.edu> gary@ellis.uchicago.edu (gary buchholz) writes:

Here's some pretty naive questions... but these CPUs inside Ham and scanner radios have got me... well... fascinated !

1. Hmmmm... My ICOM 24AT, TS-950 and PRO2006 all have "CPUs" that control the radio. When I look at a service manual and reference is made to the "CPU" this "CPU" is some funky CPU. These are not common CPUs that one might find in a computer. Exactly how are these CPU (micro processors) in radios and scanners UNLIKE traditional CPUs found in computers ?

The big difference isn't so much the CPU itself as the fact that the programming is a ROM inside the chip. No way to really "break it out".

2. Clipping diodes. Hmmmm. "Clip diode Dxx to enable undocumented feature 'X'". This is what I usually see posted regarding restoring deleted 800 Mhz coverage on scanners (like the PRO 2006). I assume this is one of the many "inputs" that the CPU can sample and thus decide (via the program) to synthesize or not synthesize a particular freq (I assume this is how part of 800 Mhz is "deleted". Beyond this ... the CPU must scan the keyboard, detect the presence of a signal etc... What kind of I/O are these devices (CPUs) capable of ? (And, by the way, HOW DOES the CPU synthesize the freq.. what kind of component does this control?)

On Icoms anyway, there is a bunch of output lines that are strobed that connect through diodes and switches to a bunch of input lines. Some of these are fixed diodes that control defualt info, usually things like the Asian, American and European frequencies and modes but also for certain features to be enabled for testing or as undocumented features. The switches are the keys and buttons that control the radio. The way the frequency is controlled is usually by controlling dividers on the PLL circuit.

3. Are the instruction sets for these CPUs readily available? Are these CPUs in radios custom chips or chosen from a "standard" set of such CPUs. How about the possibility of reading a radios program ROM, dis-assembling the program at the instruction level, modifying it and blasting this into an EPROM. The ultimate mod or beyond possibility? (I assume no reasonable person would want to do this. However, I have seen a .BIN file for the TS-440 so I assume someone has at least gone through the trouble of snatching the program code from ROM.) Sounds interesting.

Good luck with it. I know some of the older mobile and base stations
have real CPUs and EPROMs and I know of at least one person who was
hacking a Kenwood 6 meter rig this way.

Good luck. It certainly won't be easy.

I've written to system@rpiecs about the problems we're having with them dumping mail failure messages from their redistribution of the info-hams mailing list back into the mailing list and into the associated Usenet newsgroup, but after several days I've received no word that they're aware of the problem or that they're working on it.

So effective immediately, I've cut off forwarding of info-hams to that redistribution. When they've fixed it, we'll turn it back on.

Now that my license has come, I'm getting more serious about getting a CW rig up and running. Thanks to many of you, I have some idea of what kind of HF transceiver I want to get (used, probably old, around 100 watts, something like an HW-101). Since I live in a place where I can't put up an outdoor antenna, I will probably put a loop or some kind of folded dipole (I might even try a helical dipole) around the ceiling of a second-floor bedroom and run a feed line to the basement where my rig will be. Since I already have about 75 feet of 300-ohm twin-lead, I was thinking of using that for the feed line.

I still have a few questions:

Would I be better off using coax for the feed line? Why or why not?

Will I need a transmatch or antenna tuner?

Will I need an SWR meter?

Thanks in advance for any advice you can spare. I finally found the local ham radio club, so soon there may be a local Elmer I can bother with this kind of thing...

>and spacing is exactly the same.
>
>Mikef WA0VNH

I beleive that those old tabe recorders had two plugs in a single housing. These guys are each a two conductor plug.

I initially was using a two conductor plug with my IC-2SAT for an external speaker and the TNC. When I was looking at the schematic a few months ago, I noticed that the speaker jack on the IC-2SAT is actually *3* conductor. The third (ring) is sort of like a "busy channel" indicator. It has 5 volts on it when the channel is busy. Ground is sleeve and tip is audio. Its a good thing they threw in a resistor in series with the ring contact. I don't know if ICOM uses this in their speaker mikes....anyone have one?

Anyhow, it seems to me that you actually want to use a three conductor plug for an external speaker.

The mic jack is also three conductor; but off the top of my head I'm not sure what the ring is used for. I send my audio in on tip and ground the sleeve.

120. Question re:PK232 and psk modems

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-05 17:16:58 UTC
From: wejones@crdec7.apgea.army.mil
Message-ID: <9106051316.aa04675@crdec7.apgea.army.mil>
Source record: 296236

I have an old pk232, which I have used mainly for listening to RTTY
and packet transmissions. I was interested in trying to use it with some
of the amateur sats, such as for getting images from Webersat, etc, but
I read that the pk232 is strictly fsk, and that for Webersat and other am. sats
that I would need to put the pk232 in transparent mode (if I remember right)
and hook it up to a psk modem. I am confused.
* It is not clear to me what hooks up to what,
receiver-modem-pk232-computer , or receiver-pk232-modem-computer.

* Will any modem do? I saw reference to a Tapr (I think) modem. What
does this mean?

* If we are using a separate modem, what is the pk232 doing for us,
why not go straight to the computer?

* What about in reverse, ie trasnsmitting?

Thanks in advance.

123. Re: Antenna Gain Question

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-05 18:47:26 UTC
From: rmp@crashnburn.Eng.Sun.COM
Message-ID: <14570@exodus.Eng.Sun.COM>
Source record: 296239

A question was raised about how to increase the gain of a vertical antenna, and still have an omni-directional pattern. The trick is to lengthen the antenna. A popular vertical antenna with gain over a dipole is the 5/8's lambda vertical. It exhibits some reactance because its not a multiple of 1/4 lambda, but it concetrates more signal in low angle radiation than a 1/4 wave antenna. You can build longer verticals, but then the pattern starts to point UP. Some repeaters use these longer antennas, but they are on mountains, with the antennas fed from the TOP. I don't have any first hand experience with this antenna, but check out the ARRL antenna compendium.

I know this is the system ARRL uses for evaluating receivers, but I
don't like it. The problem with MDS is that it is a strong function
of the IF bandwidth used. By switching in the CW filter, you can
typically improve this number by around 6 dB or more (a factor of 2).
You could add a 200 Hz AUDIO filter to the receiver and make it look
10 dB more sensitive by this measure.

> Receiver Blocking Dynamic Range: The more dB, the better. Measures
> how easily the reciever is overloaded by signals not in the passband.
> We listen to a weak signal, and gradually increase the level of a

This has the same problem I mentioned above, since it is based on the
MDS.

> Third order intercept. The larger,(more positive) the better.

> level where they would be equal, i.e. intercept, if this linear
> behaviour extended that far. Usually, the mixer in the reciever is
> overloaded by that point.

Often, when I see MDS and noise figure numbers in a magazine review,
they don't even bother to mention the bandwidth used for the measurements.
This makes comparing different receivers impossible.

What's wrong with just listing the NOISE FIGURE and the THIRD-ORDER
INTERCEPT? If people feel a need for some kind of dynamic range number,
at least specify the bandwidth. Otherwise the number means nothing.

I built a step attenuator (see ARRL Handbook). With this, you can use a steady RF source such as a busy 2 meter repeater to measure the gain of one antenna vs another.

I have two mobile 2 meter antennas - a 1/4 wave and a 5/8 that connect to an NMO mount on the roof of my pickup truck. Since a car roof is a near-perfect groundplane on 2 meters, I can say that the 1/4 wave is a reference dipole. I put the attenuator inline with the 1/4 wave, and cranked up the attenuation until only half scale showed on my IC-02AT. I recorded the amount of attenuation, then did the same with the 5/8. I found that the 5/8 has 3 dB (+/- .5 dB) gain over a dipole.

Since the center of the reference dipole (plus image) was about 5 feet up (i.e. 3/4 wavelength), ground effects were quite severe, accounting for a 10 dB change in signal strength. I simply rolled the truck 2 meters toward the repeater, and found the maximum signal when testing the two antennas. The difference between peak and valley was 10 db.

Conclusions ? 1. On the average, more gain helps. 2. If your antenna doesn't work, move it to a higher mountain.

If the guy could copy the CW signal, it was, IMHO, bad form not to work him mixed mode. It wouldn't cost much skull sweat to return a signal report and say 73. Nobody was expecting a rag chew.

On the other hand, I remember being curious about the original post. The poster stated that the other station indicated he heard the CW. He didn't indicate that the special event station acknowleged him by callsign, or otherwise refused to work him. I wonder just what the special event station said.

For instance: Could it have been "Gee I hear some CW in there," or was it "N6XYZ, I hear you calling me with CW. Go away you twithead, we don't work no CW here." Or anything inbetween. Never attribute to malice what can be adequately attributed to stupidity (or just plain misunderstanding.)

129. Sweep tube linearity, etc. (Was: tube finals melt a lot)

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-05 22:55:45 UTC
From: ornitz@kodak.kodak.com
Message-ID: <1991Jun5.225545.6333@kodak.kodak.com>
Source record: 296248

In an earlier article, I had written about the linearity of sweep tubes and small transmitting tubes.

>A real problem with all of the sweep tubes - including the 6146 too, was the
>poor linearity of the tubes. I always wondered why no manufacturer ever used
>6550's. The power level and voltage ratings of these high linearity tubes
>would have been ideal. The Hi-Fi manufacturers were the only companies that
>seemed to use them.

Perry Scott, AA0ET, replied:

>The Radio Handbook contains a table of distortion products for various
>sweep tubes. The 6146 is rated at -24 dB of 3rd order IMD, while the
>6LQ6 is rated at -18 dB. Some of the linearity problems occur because
>of lack of tuned input, which presents a varying load to the exciter in
>a grounded grid configuration. Another remedy for nonlinearity is to
>use the venerable pi-L to keep the neighbors happy.

>I have never heard bad reports on the sweeps I use in the 520 or the
>6x6LQ6 linear. If the nonlinearity is just a specsmanship thing, then
>I'll be nonlinear. In general, I think sweeps have been much maligned
>by people that didn't understand their limitations. They are less
>forgiving of design blunders than real transmitting tubes.

I am not sure whether Perry is talking about data from the ARRL Handbook or Bill Orr's book. The table in Bill Orr's "Handbook" is from an article he initially published in Ham Radio Magazine (back in 1968, I think). The data given were for Class AB1 service, grid driven. It should be noted that some of the tubes were pushed very hard, often well beyond their normal ratings. In general, the intermodulation distortion of these tubes would be 3 to 5 dB better if they were operated in a cathode-driven mode due to the negative feedback inherent in this operation. However, we are talking about sweep tubes as final amplifier tubes in older SSB exciters, where usually two or more sweep tubes are operated in parallel, and are grid driven with a tuned circuit on the grid and plate. External sweep tube kilowatt amplifiers are a different issue altogether.

I have listed some of W6SAI's data on sweep tubes below, along with data on some other older tubes, and some data on a few higher power transmitting tubes and even one power FET. The data is for grid-driven, AB1 operation except where marked with an asterisk which signifies cathode driven operation or with a caret which signifies class AB2 operation.

MRF150 50 TMOS 250 3750 -- 333 150PEP -32
```

A few points should be noted from the data: 1) as the tubes are pushed harder to get higher outputs, the distortion products increase; 2) the 6550 tube shows considerably lower IMD than do comparable sweep tubes at a similar power level (this is expected since the 6550 was designed for low distortion); and 3) _real_ transmitting tubes, i.e. those designed for high power service, show far superior IMD ratings. Unfortunately, Bill did not publish data on the 6JB6A's and 6JS6C's popular in many early SSB rigs (Drake and Yaesu).

I included the data on the MRF150 TMOS power FET to show how far solid-state devices have come. It has excellent IMD characteristics.

Perry stated that the nonlinearity of the tubes could be handled with some extra tuned circuits. This is only partly true. Higher levels of harmonics, caused by the tube nonlinearity, were usually no problem with the tube rigs because most had excellent Pi-network outputs which required tuning (not broadbanded) and were fairly high-Q. However, the nonlinearity also presents itself as INTERMODULATION distortion, an in-band phenomena which the extra tuned circuits can do nothing about. Consider a simple case of a two-tone signal on 80 meters where two signals are to be amplified by the tube, one at 3.900 MHz and one at 3.901 MHz. Third order IMD will create new signals at 2*f1 - f2 and 2*f2 - f1, or in this case 3.899 MHz and 3.902 MHz. Fifth order IMD will produce signals at 3.898 MHz and 3.903 MHz. These are in-band signals and the extra tuned circuits will do nothing to filter these; however, they might eliminate the problems with the third and fifth harmonics. Excessive IMD can be easily heard - the SSB people call it flat-topping. Your signal gets "mushy" and your bandwidth becomes excessive; other people up and down the band suddenly hear "buckshot" from your signals. IMD increases rapidly as the tubes are driven to saturation.

So one important thing to consider if you have one of the older tube rigs is NEVER try to push the power output higher than the manufacturer recommends if you want to remain popular with others on the band (the same thing applies to solid-state rigs too).

Nonlinearity is not a specmanship thing, it causes real problems. But do not let this scare you off from using an older rig however. Most of these rigs were capable of good IMD performance by reducing their drive slightly. If you have access to an oscilloscope, it is easy to adjust the rig for the best drive levels and power output consistent with low distortion. The reduction in power will usually be slight, barely enough to show on your contact's S-meter, but the IMD will be much lower. You will also get considerably better tube life. Also keep the tubes cool if you want them to last. Usually all it takes is just turning the microphone gain down a little. I might add that you must be especially careful when using an external speech processor with many of the older rigs. By decreasing the peak to average power ratio, speech processors effectively run up the average power. Many of the older rigs using sweep tubes were not rated for this increase in average power. If you have the manufacturers original specifications, look at the difference between the SSB PEP power levels and the CW/RTTY power levels to see the effect of increased average power.

External, multiple sweep tube kilowatt amplifiers, on the other hand, are an atrocity in my opinion. The increase in IMD performance obtained by cathode driven operation is almost always lost because of the use of parallel tubes. Unless perfectly matched tubes are used in these amplifiers, distortion performance will suffer. The only thing going for these amplifiers was the low tube cost (in their day). Look at the 8877 specs if you want to see low distortion. External amplifiers are a different issue than we have been discussing, however, and I prefer to

leave the discussions on this to another day.

Paul Nix, WB5AGF, asked about RF feedback to reduce distortion. The answer is yes, it works. The best references to this subject are as he suggested, Bill Orr's "Radio Handbook". {While I find W6SAI's discussions on antennas often wrong, Bill KNOWS transmitting tubes, amplifiers, and feedback}. Paul is correct in his statements that feedback lowers stage gains while enhancing linearity.

RF negative feedback is an entirely different design problem from negative feedback at audio frequencies. To cover all of the HF amateur bands, the feedback network need cover only slightly more than one decade in frequency. With good audio equipment, the feedback network must work over approximately four decades of frequency range. This is a much tougher problem to do properly. For this reason, many of the audio phreaks have abandoned negative feedback around multiple stages in favor of inherent feedback in individual stages. Collins was about the only amateur radio equipment manufacturer that did much with negative RF feedback in their rigs that I know about. Drake in the L4 amplifier also used the trick of smaller than normal values of the grid bypassing capacitors to obtain some additional negative feedback.

Mark Bitterlich, WA3JPY, and Gary Coffman, KE4ZV, also brought up the important point that the matching network on your rig must be tuned at the actual desired power level. You cannot tune up at low power and expect the same matching conditions at high power. One good way to handle this is to tune your rig into a dummy load at the desired power level. Then switch your rig to an antenna tuner to match the antenna. Do not adjust the transmitter at all after switching to the tuner - only adjust the tuner. I have often used an antenna noise bridge preset to 50 ohms to adjust the antenna tuner. In this way, I can tune up without ever putting a signal on the air. Gary mentions the special difficulty in tuning legal-limit amplifiers. One good way to do this involves a pulsed two-tone generator and a scope. You have to use a dummy load for the tests; it is not simple but it works.

Finally Perry Scott, AA0ET, suggested that I consider designing a 6550 based project and he also asked the price for the 6550.

To start with the second issue, Newark lists the 6550 for around $32. I have seen some audio importers price some 6550's at $15 for Chinese imports. I would tend to stick with the known manufacturers. Now for around $70, I can order the MRF150 transistors. So for new design, I would rather use the single TMOS device to get essentially the same power as a pair of 6550's. With proper care, it will never wear out and I like the lower voltages because of safety. Heat dissipation is easier with the transistor too since radiation cooling and forced convection are seldom needed.

As far as retrofitting 6550's into older rigs that used sweep tubes, you will have several problems. First the 6550 has a higher input capacitance than most of the tubes it will replace. The increase in feedback

capacitance of the 6550 over most sweep tubes would also usually necessitate changes in the neutralization circuits. Thus you would have to make extensive modifications to the rigs. Finally the physical size of 6550's would mean having to greatly enlarge the final amplifier assemblies in most existing rigs.

In conclusion, I would agree with many others - if you can get one of the older tube ham rigs at a reasonable price that works well, do not worry excessively about the tubes and nonlinearity. Crank the power down a little and most of these tube rigs will work fine. Tune quickly though! Ask for HONEST signal reports from others you talk to on the ham bands. Make sure the rig is in proper neutralization and always replace the finals with matched sets (and re-neutralize after any change in finals or driver tubes). As good advice to newcomers to ham radio, find an older ham who may have used these rigs many years ago. They can often remember how to tune these rigs without the long-lost instruction manual, and they can help when you need parts or troubleshooting help too.

-- MAJOR SOLAR FLARE ALERT --

JUNE 06, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

Region 6659 has spawned yet another very powerful solar flare. This event, like several of the other flares from this region, saturated the GOES sensors at the class X12 level for between 20 and 25 minutes. The true intensity of this flare is unknown (it was well above a class X12 category). The optical component was rated 3B. A moderate intensity Type II and a major Type IV sweep were observed with this event. The flare began at 00:58 UT, peaked at 01:08 UT and ended at 02:47 UT on 06 June. A major HF blackout was also observed with this event.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

A high terrestrial impact is expected from todays major flare. Major to severe geomagnetic storming is expected to occur in association with this major event sometime early on 07 June. A-indices of greater than 50 are likely, with a risk for A-indices greater than 120 on 07 June.

Protons are expected from this most recent flare. A PCA event is also anticipated, although the intensity of the PCA is not expected to be severe. Proton levels are expected to reach 3,600 to 3,700 pfu.

Auroral activity will continue at high to extremely high levels over the next 24 to 72 hours. These high levels of activity are expected to continue as major flaring from Region 6659 continues.

Major HF impacts, which have already been observed, will continue for the next 24 to 72 hours. As Region 6659 continues to move into progressively more sensitive areas of the solar disk, the risk for increasingly intense PCA activity will rise. The next week to 10 days do not look good for HF radio propagation conditions. Major HF blackout conditions are possible over the sunlit hemisphere during major flares.

Conditions suitable for widespread VHF auroral backscatter will continue over the next 12 hours, with a return to favorable conditions early in the UT day of 07 June. Significant levels of flutter and auroral-induced anomalies will be observed throughout the next several days.

Major flaring is expected to continue over the next 48 to 72 hours, at least. Projections estimate major proton flaring to be possible throughout the next week.

** End of Alert **

135. MAJOR GEOMAGNETIC STORM UPDATE - 06 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-06 05:27:47 UTC

Source record: 296254

/\

GEOMAGNETIC STORM UPDATE

/\

05:00 UT, 06 June

STORM UPDATE INFORMATION:

Geomagnetic storming is continuing at major to severe storm levels.
The intensity of the storming has decreased slightly over the past six hours,
although major to severe geomagnetic storming is expected to continue for the
next 12 to 18 hours. Thereafter, some additional decay in activity can be
expected.

However, the most recent major flare (class X12+/3B event) was
associated with major Type II and IV sweeps, and is expected to produce an
additional strong interplanetary shock sometime after 03:00 UT on 07 June.
The activity associated with this event is expected to cause storm activity
to reintensify to major to severe storm levels. Conditions do not look good
for the rest of this week and possibly even the early part of next week.
Region 6659 is expected to continue to spawn major flares for the next three
days at least. And with each passing day, this region will continue to move
into a better position for inflicting high terrestrial impacts.

The most recent major flare is expected to produce another PCA
enhancement. Absorption levels should pass PCA event thresholds. Polar and
high latitudes are warned to expect continued proton-related anomalies over
the coming week.

HF propagation conditions have been fair to extremely poor. Blackout
conditions have been observed over many regions, particularly over the higher
latitudes. Polar cap absorption associated with continuing proton activity
has also degraded polar and high latitude signal propagation on the HF bands.
Errors do exist on polar and high latitude navigational paths.

Extensive VHF auroral backscatter openings have been possible on a
global basis over the past 24 hours. Conditions have been very favorable for
unusual VHF scatter propagation. These conditions are expected to continue
for at least the next 12 hours. On 07 and 08 June, conditions should again
become very favorable for VHF scatter propagation as storm conditions
intensify.

Auroral activity has been high to extremely high. Low latitude auroral
observations have been widely possible over the past 24 hours and are

expected to continue to be possible over the next 12 to 18 hours. Auroral activity could again be observed over the lower latitudes on the evening of 07/08 June. Frequent sightings may be possible over the next week to 10 days as Region 6659 continues to produce potent major flaring and possibly high terrestrial impacts. Todays most recent major class X12+/3B event could produce levels of auroral activity sufficient to be observed from Florida. Sightings of auroral activity from Hawaii may become possible over the coming week if very powerful solar flaring continues.

A short PCA event was observed on 04/05 June. The event began at 15:20 UT on 04 June and ended around 09:00 UT on 05 June. Absorption levels are still above normal (presently running at around 1.2 dB) and will remain above normal over the next 24 hours. 10 MeV protons are presently hovering near 90 pfu.

Protons are expected to become enhanced once again as we feel a proton impact from the most recent major flare. Levels are expected to reach 3,600 to 3,700 pfu.

Another update will be posted later this UT day.

Hello

I have a bit of a problem with my logbook program.
Its called Loigc and made by PDA software in the US.
It does all the usuual logbook chores including a
DXCC tracking utility. My problem is that it
doesnt seem to be updating the DXC countries list.
For example, I have worked HL on 20M and I
can go into the database and find the record.
But when I print out the DXCC list it
tells me that I need HL??????

Does anyone know what is wrong here??

Would be grateful for any help!

The price for the kit is $129 and the cabinet is extra. The radio requires
12 volts to operate and is a synthesised rig with a nominal 2 watt output.
The synthesiser is diode programmed and is laid out for six channels though
it would be very easy to control it from the parrallel port of a computer.
I won't comment on performance specs until I complete mine and tune it
up. I'll post actual measured specs at that time.

No, you need a special PSK modem. TAPR sells a nice kit and the G3RUH is
commercially available from Paccom in Fla and as a kit from Radiokit.

> * If we are using a separate modem, what is the pk232 doing for us,
> why not go straight to the computer?

The pk232, operated in KISS mode not transparent mode, gives you channel
access control, packet framing, CRC calculation, and memory buffering.
The Webersat pictures are transmitted digitally as UI packet frames.
You can use an internal board in your PC instead of the PK232 to give
you the necessary packet framing, but if you already have the PK232,
there's no reason to buy another card. You can't just use a serial
port. On a Mac, you can just use the serial port because the Mac uses
an 8530 that can be programmed to do the framing and CRC, PCs don't.

> * What about in reverse, ie trasnsmitting?

Yep, you can transmit with this setup too. One additional thing, you
need an SSB receiver to copy these PSK birds.

>73 & Thanks in advance, Jim n2mpt

I built a dual band (2 mtrs & 440 MHz) J-Pole of 1/2" copper pipe. Don't know where the design came from - another ham sent me an xerox of the drawing and dimensions.

I don't have any 440 gear, but the performance on 2 mtrs is so much better than the vertical dipole which I was using (same height & same coax) that I'll never go back to a vertical dipole.

I think that end effect and conductor diameter will have more effect on the required length than any "velocity factor", and will be less than measurment error and other uncontrolled factors. Just cut it to the calculated dimensions and you will probably be able to use the matching network to achieve acceptable SWR.

73 and good luck.

Recently there was a listing of Aplink stations. Is there a summary laying around of what aplink is and how to use it?

thanks,
Dj

145. Scanners

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-06 15:25:11 UTC
From: sehrlich@helios.northeastern.edu
Message-ID: <memo.1085515@lynx.northeastern.edu>
Source record: 296271

I am finally settling down. I do think I will be getting the
Yaesu FT-411E handheld tranceiver.
Now, as far as scanners go, I am going to set my sights a bit more
locally (financially, too), and look into a couple of handheld
Radio Shack scanners. (Locally, because there a dozen RS stores
near me). Can anyone tell me if the Pro-36 handheld scanner CAN
receive 800Mhz even though the scanner is not supposed to? Was this
area written out of the ROMs, or is there a clippable resistor or
something to make this area available? Also, would it be possible to
access the additional areas the RS catalog shows as frequency breaks?
(i.e. ...148-174Mhz, 380-450Mhz... - there are breaks between 174 and
380Mhz. Can this area be accessed or not?)

Thanks again for any info.

Also, any thoughts about this scanner? Good? Bad? No opinion?

Scott [sehrlich@lynx.northeastern.edu]

146. Re: GEOMAGNETIC STORM UPGRADED TO MAJOR CATEGORY STORM

My kids and I observed a bright aurora last night (6/5) from about 11:00 pm to about 1:00 am (6/6). The major part of the aurora was in the north to northeast and was between 10 degrees and 30 degrees up from the horizon with occasional streamers extending to about 45 degrees high.

The brightest part of the display was around 11:00, which was when we first went outside to do our periodic clear-sky check. It appeared mostly greenish although long streamers sometimes ended in faint pinkish patches.

Since we live at the base of a mountain (to our south) in the countryside the skies are very dark here except for some city-glow from State College about 10 miles northeast of us. The aurora was clearly distinguishable from the city-glow although it was undoubtedly slightly hidden in the immediate direction of the city.

147. "Gain" of a rubber duck antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-06 15:36:19 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <6848@vela.acs.oakland.edu>
Source record: 296268

Back to the antenna gain question.
So, a 1/2 wave dipole antenna has 2.2 dbi or 1 dbd. And since all energy
is radiated from an antenna (assuming no loss in transmission cable), then
the only difference between antennas is the radiation pattern. So the
question is what kind of "gain" and radiation pattern do those "rubber ducky"
antennas have? I would assume it would be closer to an isotropic source.
Then would it also be safe to assume that an isotropic source does not make
a good antenna (if you could really build one)?

Get a copy of "Simple Low Cost Wire Antennas", by Bill Orr. Avaiable through QST, CQ, and any ham store. He describes coax matched 5/8 verts for 6 through 20 meters. Easy to make, great to use. I've got one for 20 up right now in a tree in the back yard. Good omni gain over a 1/4 wave vert. Nearly invisible to the rabid hordes of anti RF neighbors.

The AOR AR-1000 has a concentric volume and squelch control,
as well as a rotary switch tuning knob at top.

The volume and squelch knobs don't seem to be very ergometrically
designed. The volume knob seems especially small!

Does anybody know if any of the knobs used on HTs will fit the AOR
AR-1000? A matched set that also would fit the tuning knob would
be best.

If you want to get fancy, you can go to colinears. Four elements are good for about 8 dBd (I think, memory is a bit hazy) and if you use folded dipoles and 300-ohm line to feed them the harness is pretty simple. Mechanical problems do arise, however. This is probably more appropriate for a fixed site than a mobile (unless you were building for one of the UHF bands, in which case things are physically small enough to become manageable).

Boy, these stories remind me of the good old days when I worked for the Naval Electronics Systems Test and Evaluation Facility and the govt. actually PAID me to break radios !! In the early 70's, the Navy needed to do a real quick procurement of VHF FM HT's - so they had to buy commercial gear rather than take the time to develop militarized ones. But we still did full military environmental testing on a whole batch of different radios. I was pretty amazed at how well these held up in the accelerated life test- running for weeks on end in a HOT (150 deg F maybe) chamber strapped to a vibration table shaking the hell out of them. Most seemed to do pretty well on the two shock tests as well - One is a standard calling for drops from roughly chest height onto a steel plate at random orientations (plus selected worst case orientation). The other shock test used a big (400 lb maybe) hammer dropping 10 ft onto a spring mounted platform to which the radios were strapped - no case damage here but boy would this make the guts go flying out of some pieces of equipment (BTW this was the light weight shock test - honest).

But my admiration for militarized gear went up considerably after seeing what the environmental tests did to the commercial gear. My favorite was the salt fog chamber - A big plexiglas box with hot air blowing through a saturated slat water solution. The radios were suspended in the fog - in about 24 hours most were reduced to a handheld lump of mush.

Second most favorite thing was strapping big fiberglas vertical antennae onto the vibration table and watching the 2-3 ft standing waves.

We also had a 40kw SSB (4ISB actually) transmitter in for testing that would load up just fine on 75 phone - but that's another story.

Source record: 296272

In response to Barry's (WA4VZQ) good comments, you can help "fix" external sweep tube linears to an appreciable extent AND avoid the near impposible feat nowadays of finding matched tubes. If
you have 4 (6) sweep tubes in parallel, and they have some control grid bias supply as most of them do, install four 10K Pots, one for each control grid. Individually adjust the control grid bias until you have equal and reasonably low static plate current. You don't want most of the small average plate dissapation used in idling. This will tend to balance the load among the four tubes somewhat. However, to do a better job of it. Put only one tube at a time in the amplifier, set your RF drive to a reasonable amount and adjust the bias on each tube, one at a time to get the same power output from each tube in its respective socket. Then check idling current on each tube to make sure that you are still well under the idling current for reasonable average no-signal plate current. This will extend the tube life, and lower distortion. The best way to check idle current is probably to put a 10 ohm 1 watt resistor in the lead of each cathode and measure the DC voltage across the resistor with no drive. A digital voltmeter helps here as the voltage is pretty low (0.1 volt range.) Remember THE HIGH VOLTAGE IN ON when making such tests. K9ALD

>
>Would I be better off using coax for the feed line? Why or why not?
>
Will I need a transmatch or antenna tuner?
>
>Will I need an SWR meter?

I wouldn't recommend you try something as radical as a helical dipole as a beginner. Not that there's anything that mystical with one, but you don't need the aggravation of oen or two more variables to deal with in antennas when you are just starting out.

A transmatch is an antenna tuner - just a particular type. You will definitely benefit from an antenna tuner. As I recall, the HW-101 and like rigs are designed for 50 ohm input/output nominal impedance. Anything a whole lot different from that is not going to work well, if at all. You can, of course, buy from an amazing range of antenna tuners available commercially. A tuner is not much more than a hunk of wire formed into a coil and a couple of variable capacitors -- sometimes a couple of switches for convenience -- all things salvageable from junk radios or available cheaply at ham flea markets. Breadboard it on a piece of plywood, pc board or other non-conducting surface. Metal cabinet shielding comes later when you are informed that TVI is a problem. Given a finite amount of money, you will be better off investing in a good low pass filter to go between your rig and the antenna tuner and build the antenna tuner breadboard style than to spend the money on a commercial antenna tuner and use it without the low pass filter.

Another ESSENTIAL element is a GOOD GROUND. There are RF grounds and there are AC/DC grounds. The former is essential for your neighbors sanity and effective communications, the latter essential for your personal safety. One hopes at the outset of establishing a ground system that the RF/AC/DC grounds turn out to be all one and the same. Sometimes they are. Usually, they are not. To insure a good RF ground - maybe more appropriately called a counterpoise to the antenna -- cut a 1/4 electrical wavelength of wire (any type, size) for each band upon which you will transmit. Lay it around the floor of the room, by the baseboard or wherever it is out of the way. It may be bent, go around corners,

into adjacent rooms, whatever; as long as you do not fold it back on itself (i.e. no tight 180 degree turns!). The counterpoise should be connected to the ground terminal of the antenna tuner. The AC/DC (and RF) ground is best accomplished by a heavy wide braided tinned copper strap of less than 8 feet in length to actual earth ground -- a 8 foot (minimum) long rod driven into the ground and/or a short stake connected to 60 linear feet of #10 bare copper wire that is buried 1-2 inches underground. Can't quite make this scene? Then try short(as short as possible, but maintain the heavy duty conductor - copper strapping, braid or something on the order of #6,8,10 bare copper wire) connection to nearby cold water pipes (metallic, not plastic), hot water or steam heating pipes or structural steel elements of the building. DO NOT attempt to use the neutral side of the house wiring nor the protective ground of the house wiring as the sole ground for your ham station. That can become an electrifying experience not to mention propagating interference throughout the building.

Many antenna tuners include transmatches but it is not a necessity. There are a lot of devices (including the metering on the transceiver itself) that can indicate when you are transferring maximum power from the transmitter to the antenna and/or radiating it from the antenna. In my novice days, I used a neon bulb (still available at Radio Shack) and occasionally a flourescent tube held near the antenna and the tuner/transmitter tuned for maximum brightness. Sure, I got a few RF burns, but they healed. It works! I didn't know if my SWR was 2:1 or 5:3 and it didn't matter at the time - I was communicating!

For simplicity sake, I would suggest a 40 Meter folded dipole or if space is a limiting factor factor, a 10 and/or 15 Meter folded dipole fed with the same 300 ohm twin lead that the antenna is made of. The same would apply if you opt for a loop antenna. That way, the feedline impedance is pretty close to the antenna impedance for the folded dipole and while different for the loop, can be tuned o.k. by the tuner.. You could use one piece of twin lead and fashion a dual band dipole (each conductor becomes a seperate antenna for a different band when cut to the appropriate length) but then the feedpoint impedance is something between 30 and 75 ohms -- not a good match for the 300 ohm feedline; a case for 50-52 ohm coax.. On the other hand, if the antenna is in the room with the transmitter and the feedline length is on the order of 6-7 feet, what the heck, the loss is negligible and the antenna tuner should take care of the matching. Just a note: 300 ohm twin lead is pretty lossy anyway. It's fine for the beginning application you describe but don't get carried away with great lengths of the stuff in an outdoor transmitting environment - it simply wasn't made for that application.

My two cents on your suggestion of a HW-101: The HW-101 was/is a good beginner rig and gives a good bang for the buck. Its receiver is NOT selective on CW so has limitations in the 80-40 Meter Novice CW bands. On 15 and 10 Meters, there is enough bandwidth that you can usually find room. Remember that the HW-101 was built by someone from a kit - not assembled by a professional assembly line. The problem possibilities are too numerous to list so be very BEWARE of what you are buying. (Would you know good versus bad soldering joints if you saw them?) Better yet, try before you buy. Personally, I would recommend shopping hamfests or used equipment dealers for a Drake TR-4 or something of

like ilk. In any event, associate yourself with a radio group and ASK FOR HELP. Many times, radio clubs and/or individual members thereof will have a beginner rig they will loan you until you get into the hobby and learn a little. Hams are a little crazy - they buy such stuff at hamfest flea markets and refurb it just to have it around to help a guy get started! It never hurts to ask for help and the advice can often save the pocketbook excessive damage.

Good luck, 73

Source record: 296277

B.J. (N3JLQ)
The PK232 has a modem disconnect header on the board which allows you to disconnect the internal 300/1200 baud AFSK modem and connect in a different modem. All other functions internal to the PK232 remain the same. For example, MFJ builds a 2400 baud AFSK modem that can be attached to the PK232. TAPR (Tuscon Amateur Packet Radio Association) has PSK modems available for the application you mention that are compatible with the PK232. I have heard, but do not know, that AEA may also have a PSK modem available now. Hope that helps.

This assumes no mismatch loss and no dissipative losses in the antenna.

> the only difference between antennas is the radiation pattern. So the
> question is what kind of "gain" and radiation pattern do those "rubber ducky"
> antennas have?

A "ducky" is a physically shortened monopole. In conjunction with a good
ground (to mirror the other half) its pattern and gain look almost like a
full size dipole. The above zero loss assumptions are generally not very
valid and contribute to its relatively inferior performance when compared
with a full size dipole.

> Then would it also be safe to assume that an isotropic source does not make
> a good antenna (if you could really build one)?

It would be 10*log(120/73) = 2.16 dB below a fullsize dipole.

164. MAJOR GEOMAGNETIC STORM UPDATE - 07 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-07 01:16:17 UTC
From: oler@HG.ULeth.CA
Message-ID: <910606191617.21c027ac@HG.ULeth.CA>
Source record: 296136

/\

GEOMAGNETIC STORM UPDATE

/\

01:00 UT, 07 June

STORM UPDATE INFORMATION:

Geomagnetic storming has presently ended. Generally unsettled to active conditions have been observed since approximately 06:00 UT on 06 June. However, geomagnetic storming is expected to redevelope sometime in the UT day of 07 June. Activity is expected to become major to severe once again as yesterdays major class X12+/3B flare begins to have an impact.

The most disturbed day of the period should be 08 June. Geomagnetic activity on that day is expected to be at major to severe storm levels throughout much of the day. Planetary A-indices are expected to range between 60 and 150. Planetary K-indices of between 5 and 8 are also possible. K-indices of 9 will be possible over the northerly middle and high latitude regions.

Geomagnetic activity should become more dormant by 10 June, barring further energetic flaring. Major flaring is expected to continue from Region 6659 over the next 3 to 7 days at least. It is maintaining a very potent optical and magnetic configuration and has maintained its overall size. White-light flares from this region may be possible.

HF propagation conditions are still well below normal, although improvements have been observed lately. Conditions are expected to become strongly degraded on 07 and 08 June as geomagnetic storming redevelops. Polar latitude PCA activity has blacked out radio signals over many high latitude and polar latitude regions. Absorption levels are currently running at values near 2.8 dB (above event thresholds).

PCA and proton activity are expected to continue over the next several days. Protons are currently hovering near 240 pfu at greater than 10 MeV. A significant enhancement in protons could occur if another major solar flare erupts from Region 6659. This region is continuing to move toward the central solar meridian and will therefore become increasingly capable of producing stronger proton impacts.

VHF propagation conditions have returned to semi-normal over the past 24 hours, although instabilities and some unusual conditions have been reported. VHF backscatter communications are expected to recur as geomagnetic storming

redevelops on 07 and 08 June. Significant and widespread VHF backscatter may exist on these dates (particularly 08 June).

Low latitude auroral activity is expected to become possible again late in the evening hours on 07 and possibly 08 June (local time). The Low Latitude Auroral Activity Warning is being held over until 08 June. If the expected shock fails to arrive by then, the warning will be reassessed.

The next update will be later this UT day.

An HT with a rubber duck antenna inside a car is as close as you can get to
a dummy load and still be able to call it an antenna.

>twin-lead, I was thinking of using that for the feed line.
>
>I still have a few questions:
>
>Would I be better off using coax for the feed line? Why or why not?

If you are going to feed an odd antenna, balanced line has distinct advantages. Losses will be lower for a given SWR and multiband operation with a non-resonant antenna will be easier. If your antenna will be inherently unbalanced or if the antenna will be resonant at near 50 ohms for your operating frequencies, or you have special feedline routing problems, coax may serve you better.

>Will I need a transmatch or antenna tuner?

If you use balanced line, or non-resonant antennas, or antennas with unusual feedpoint impedances the answer is yes.

>Will I need an SWR meter?

It is a cheap and somewhat useful instrument. More useful would be an impedance bridge or a dip meter or a field strength meter.

The LOW BATTERY begins flashing on my Uniden Bearcat 200xlt even though
I measure nearly 7.0v across the battery (yes, loaded!). I think this
is a known problem with this scanner. I seem to recall a posting about
a mod to this scanner for this problem. A search of the mods database(s)
yielded nothing. Does anyone know of such a mod, or what else should be done??
I'll summarize to the net.

My understanding was that ARRL staffers were providing these tables of contents. I think it's a valuable service. If someone wants to post other tables of contents, I think that would be a valuable service too. But I don't think the QST and QEX postings put the posters under any obligation to give the same information for all known periodicals.

If you think some periodical should be represented, either encourage them to do it, or do it yourselves. Don't complain about the few who DO provide something good just because others don't.

The extra rings on the Icom radios are for two things. One (the one on the mike jack) is for the VOX headset to get its power. It is also resistor "protected". The other (the one on the speaker) is for the transmit led that some Icom mikes have.

Message-ID: <memo.1087378@lynx.northeastern.edu>
Source record: 296168

I am going to be purchasing the Yaesu-FT-411E via mail order from either Texas Tower or Ham Radio Outlet of New England. I bargained (sp?) the same price from each company. Question is, what are peoples' experiences with mail order from these two companies? My check is in hand, I am just waiting to put one of these company's names on it. Which one should it be? My main interests are promptness and merchandise which is in perfect condition upon arrival to my home. Also, should I insure my check? It's a personal check.

Thank you very much in advance for you replies.

Scott [sehrlich@lynx.northeastern.edu]

Steven D. Kuo N8OPH states:
>So, a 1/2 wave dipole antenna has 2.2 dbi or 1 dbd. And since all energy
>is radiated from an antenna (assuming no loss in transmission cable), then
>the only difference between antennas is the radiation pattern. So the
>question is what kind of "gain" and radiation pattern do those "rubber >ducky"
antennas have? I would assume it would be closer to an isotropic >source.
>Then would it also be safe to assume that an isotropic source does not >make a
good antenna (if you could really build one)?
>

WRONG ASSUMPTION(S).....
NOT ALL ENERGY IS RADIATED FROM AN ANTENNA!
Some, sometimes a lot, is wasted as HEAT. An antenna is an interface or coupling device between a receiver/transmitter and the electro-magnetic fields surrounding the earth. It is less efficient than the 100% your statement implies.

Generally speaking, the longer the antenna in terms of physical and electrical wavelengths at the operating frequency, the more efficient it couples to the natural wavelengths of the E-M fields. Keep in mind that an antenna exhibits both capacitive and inductive characteristics. Capacitive and inductive coupling depend upon physical cross sectional area, among other factors. The shorter an antenna is, the less efficient it becomes at coupling. Energy in the antenna not coupled to the E-M fields is lost as heat - in the antenna conductor, feedline and final amplifier circuits.

A half wave antenna is a compromise between convenient physical size and efficient coupling. A quarter wave vertical is really a half-wave in disguise - the other 1/4 wave is either perpendicular to the radiator (the so-called ground plane), at some angle or is made up from the shield of the feed line (which may combine to form a vertical half wave), etc. Half and quarter wave elements are convenient to work with in devising gain arrays. Therefore, we see and use them a lot.

"Rubber Duckies" are inefficient antennas - usually helical in nature which means that an electrical fraction of a wavelength has been achieved at the expense of the physical coupling cross sectional area involved. The helical coil may be approximately a half wavelength when stretched out, but it is compressed in length when wound on the antenna form. Thus it does not couple efficiently to the E-M fields, the natural wavelength of which are not compressible in a physical sense. Think of Rubber Duckies as being the unshielded resonant circuit in the final amplifier of your transmitter. How well would you expect the tank coil to couple and radiate? Feed a "Rubber Duckie" from a 100-200 watt amplifier and you will most likely see it burn!

Pattern of a "Rubber Duckie" in theory should approximate that of a 1/4 wave antenna in the same physical position but with less magnitude - the counterpoise or other 1/4 of the 1/2 wave antenna is the metallic case of the handitalkie to which it is attached. Plastic case HT's may have a helical copper wire inside the case to form the counterpoise. No, it does not approximate the pattern of an isotropic radiator.

An isotropic source is not a PRACTICAL antenna in any sense as it exists as a dimensionless point in space (i.e approaches infinity). It is merely a theoretical concept establishing a reference for antenna gain expressed in dbi.

I assume you were originally a NO CODE Technician

Upon passing the 5 wpm 1a you were given a CSCE
(certificate of successful completion of examination)
for the 5 wpm

Please retain this certificate, as it is your only
evidence of your privileges below 30 MHz.

You will receive NOTHING ELSE

The VEC will retain the test results and forward same
to FCC so you will be a Tech Plus in the data base.

Note that one with no license whatever may take the 5 wpm
before 2 Generals-or-above, but

one who is already a Technician must take the test at a
seheduled VE session

Congratulations!

What magazine? QST always mentions the bandwidth used. (Granted, this wasn't always true, but with regard to QST you are complaining about a problem that has already been fixed.) Thus the conversion to noise figure is straightforward if you are willing to assume a rectangular bandwidth (a pretty good assumption with modern IF filters).

>What's wrong with just listing the NOISE FIGURE and the THIRD-ORDER
>INTERCEPT? If people feel a need for some kind of dynamic range number,
>at least specify the bandwidth. Otherwise the number means nothing.
>
>AL N1AL

Of course, if we gave only NF you'd have to assume rectangular bandwidth if you wanted to know MDS, too.

I think MDS is a little easier concept to grasp for the average amateur. After all, however you specify it, what you are trying to answer is the question, "how weak a signal can I hear?" QST is just giving the answer directly. And there's no doubt in my mind that IMD dynamic range is an easier concept than third-order intercept point for most hams. It's also a good real-world indication of the strong-signal handling ability of the receiver. The bottom line is, QST tries to make the measured performance of the receiver understandable to the largest number of readers, not just the cognoscenti. And since those who are interesed can easily calculate N.F. and 3rd-order intercept from the data given, I really don't understand the basis of the complaint.

>for the beginning application you describe but don't get carried away with
>great lengths of the stuff in an outdoor transmitting environment - it simply
>wasn't made for that application.
>

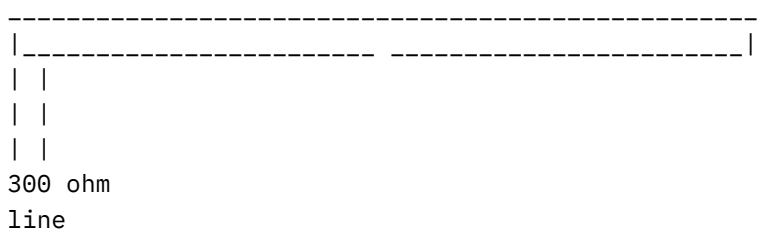
Rick Pottorff also replies:
>
>Me: If you get RG8, or equivalent. It has less loss than 300 ohm. You'll
>probably have a high swr in your feed line, so you'll want to minimize
>the losses.
>

Where did this piece of mis-information come from? Clean, new, 300
ohm twinlead has very low losses. If you get the foam type, it works
even better, with respect to weathering. I refer you to the ARRL
antenna book, p 24-18 in my edition, which show RG/8U having 1 dB

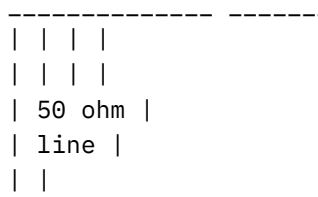
of loss per 100 ft at 20 MHz. 300 ohm 'tubular' line has about .45 dB
of loss per 100 ft at 20 MHz, and is quite a bit cheaper. admittedly
I wouldn't use the flat ribbon stuff outside, and expect it to perform
well for long, or to handle lots of power, but I have used the foam stuff
with reasonable success.

Should he use twinlead to feed his dipole? I don't think so.
While its correct that a folded dipole will match the feedline impedance of
300 ohms ok, he will need an antenna tuner (transmatch, what's the difference?)
and/or a 4:1 balun, to match his *unbalanced* 50 ohm HW-101 to the
balanced 300 ohm feedline. A beginner shouln't have to fuss with all
that just to get on the air. Use coax. RG/58 is fine, as long as you're
not running 200 feet of it. Try to cut the antenna to a half wave with the
formula 468/f feet. Don't worry too much about the SWR. The HW-101 can
match reasonable loads. If the feedline is short (< 50 feet, say), a high
SWR is not going to kill you. What's important is that the HW-101 is able
to load up into the antenna, and the plate current is what you want.

Another aside, I think that Doug's notion of a 'folded dipole' and
the folded dipole that Wayne and I are talking about are two different
things. Wayne and I are talking about this:



I think Doug means:



i.e. the ends of the dipole are 'folded' around the sides of the room.

Lotsa luck, Doug!

> GU3HFN - 11/90 CQWW DX CW - via CB addr

This is way too early to start getting worried about CQWW QSL's. JE1CKA always comes through, but you need to be prepared to wait about 12 months. I got mine from the '89 CQWW just about the time CQWW '90 rolled around.

Incidentally, the CQWW cards seem to be rolling in right now. I got my CY9CF cards yesterday, and about 2 weeks ago got my JX7DFA card. That was a special one: it was the very last QSO he made in the whole 'test (a new mult just as the bell struck). The ZS9/W6KG (Walvis Bay) card came just a few days ago, and YASME is usually much faster than that. Just think about licking and sticking 10,000 or so envelopes yourself and you can imagine why some of these drag a while.

As far as HC8A is concerned, I haven't received mine yet either...somehow, I don't expect to see them ever. In order to get permission to use the HC8A club station, the op had to agree to let the club (at Box DX) be the QSL manager. Draw your own conclusions about why they wanted to do it so badly.

Hi,
I am studying now to get my Novice licence next week (WITH code,
by the way), and being a poor EE student, am interested in porinters to
articles/schematics for building your own CW rig. I do pretty well
in electronics, and feel confident to be able to build something not
to difficult.

An antenna may be a problem, since I live in a mobile home,
and I don't know the rules about antennas here. But I _have_ learned
a lot about antennas in general. My mobile home has aluminum siding
all around, and it acts like a BIG Faraday cage, and my TV reception from
indoor rabbit-ears is TERRIBLE :-).

Also, I bought an amateur radio mag looking for some company which
sells inexpensive CW keys (not the iambic kind), and you know, I didn't
find ONE comany advertising that stuff!! Anyone have suggestions?

Steven

Yea, it could be construed as a blatant ad. I don't find it crass,
because I think it's relevant to the discussion here. I would also
find it relevant if people posted TOCs from PopComm, MonTimes,
or from any relevant book - sort of like posting reviews.

It's not like the guy who posts these TOCs is grubbing money. Even if
Havana Moon posted TOCs from his numbers newsletter it wouldn't bother
me cuz it would be relevant and I suspect he's not getting rich off it.

192. scanner review AR2500

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-07 18:18:50 UTC
From: mycal@everexn.com
Message-ID: <1991Jun7.181850.12000@everexn.com>
Source record: 296103

Well guys and gals I have just received my AR2500 scanner. An here are my first impressions after about 8 hours of messing around with it.

First I will have to say when I opened the box I was disappointed on the construction of the scanner. It is in a cheap plastic case and the rotating controls (volume, bfo, squelch) felt sloppy like a budget stereo. An external speaker that I purchased with the scanner was worse, with the space where its name plate used to be showing nothing but glue. (I later found the name plate at the bottom of the box.)

So before I turned it on I scanned the manual. It was something that was done at the local copy store using plain copy paper with a plastic cover, and spiral bound. (At this time I was thinking about packing it up and sending it back.) I read the manual, it was informative and right to the point with little useless drivel that I am accustom to in most manuals. It even had a great section on programming the scanner with the RS-232 port, (which was the major reason I wanted this scanner.) It seemed no information was left out, or that you had to buy some "programmers guide/kit" for extra money (like many other manufactures would have done.)

Feeling a little better about the scanner I fired it up and tried to see what I could hear. Being no scanner expert I checked out the HF bands first. Tuned in some broadcast stations, some CW transmissions, and a few ham SSB transmissions. The unit has a BFO with a course adjust -4 to +6 Khz and a fine adjust -.5 to +.5 Khz. Which came in handy since the scanner only scans in 5,25 and 12.5 Khz steps.

The scanner has two kinds of programmable banks. One type holds 32 frequencies and the other holds 2 frequencies (top and bottom). The second is what they call a scan bank, give it a start and stop frequency and let it find stuff. This is what I used to scan the 860 to 890 band. I know, I know I'm not supposto do that but that was the only place I knew for sure there was action. And boy was there action! It seemed to do a great job in this band. Much better than the HF band (maybe it was because of the short little antenna :).

A little later on I discovered that the up/dn tuning knob was defective, only stepping down on occasion. I was not happy.

The next day I took it to work and we listened to the local politicians make deals with some local developers (no kidding!). And I hooked it up to one of my computers and tried the RS-232 out. It was a little funky at first, 'cause there is no handshaking but after a little experimenting and improvising I think I can make it work solidly. (If any one is having problems with this interface let me know, I may be able to help).

I am still up in the air over if this is a good deal or not. The scanner design and function seems to be good, but the workmanship is cheesy at best. It looks and feels cheep, but works much better. I am going to send it back and get it fixed and try it again, and maybe I won't ask for my money back. (I think I may really like its functionallity, but I need more time to decide.)

Please Reply to the following!

Since I know little about scanning and scanners, maybe some of you can fill in some gaps in my knowledge. So I can make a better judgment on how good/bad this scanner really is.

One other gripe I have is that the Squelch doesn't seem to have enough range to squelch out high levels of noise. Should it?

When scanning I sometimes come across oscillations that put the s-meter in the red, is this normal? or is it related to some internal oscillator in the scanner.

There seems to be alot of noise from 1-400mhz, static type noise that pushes up the s-meter a little, I would expect it form 1-60mhz in the day but above that? What would cause that?

How selective should a scanner of this type be, Example when a local cell is transmitting it could span for 15-20khz. A strong HF broadcast station might span 15Khz. Is this normal? For this type of scanner?

The above questions would help out alot. Thanx

Some other specs that you might be interested in are :
Modes-
Narrow FM, Wide FM, AM, AM+BFO

Scanning increments-
5,12.5, and 25khz
32 Channels per second

Search banks
1-62 at 32 frequencies per bank
You can chain banks.
You can have a priority bank.

Scan banks
63-78 with 2 frequencies per bank (top and bottom)

RS-232-
All front panel functions can be done with the RS-232 at 300,1200 or 9600 baud (auto detect).

Toll Free 24 hour tech support (I'm going to try them out today):
1-800-445-7717 - though they claim you may have to leave a message at 3am.

Well that's all I know now. If I find out anything else I will let you know.

mycal@everexn.com

Jack of all trades master of none. (well maybe ...)

No. Many people, some of them non-hams, may see an article that interests them and buy that particular issue. The ARRL is non-profit. Their job is to interest new people in the hobby and keep the rest of us informed. Their posts are informative and not commercial.

There are two mods immediately available!

First, If you haven't seen this little handheld, look for it!

This is like having a solid little Motorola in your palm. The sensitivity is very very good! I'm impressed so far!

First Mod: Open the back of the radio and discover a Red Wire. Cut the red wire. Re-assemble the radio. Reset the radio and voila you now have airband! press the B key and airband receive mod is complete.

Second Mod : Perform everything like the first mod except find a Blue added wire. Cut the wire for broadband. Reset radio and your done.

More later.....

Brian, you're just being too sensitive!

I actually appreciated the posting, and hope the ARRL continues (and the
QEX contents too). Providing the abstracts for each article save me time
(since I don't subscribe, but pick it up occasionally at the newsstand),
and I doubt if I am unique in this regard.

It also provides a nice snapshot of the state of the hobby (a subset, of
course).

I hope they continue the postings.

199. Active Biasing Arrangements For Tube Amplifiers

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-07 22:22:00 UTC
From: nix%muppet.DEcnet@consrt.rok.com
Message-ID: <9106072129.AA18047@ucsd.edu>
Source record: 296167

There are two or three similar `conversations' running on
the Info-Hams digest, all having to do with tube linearity.

In one recent discussion, parallel tube biasing was discussed, and
it got me to thinking about the old multi-sweep-tube amplifier that
Galaxy put out back in the late 1960's. I can't remember the unit's
name, but believe that it ran about 10 6HF5 tubes in parallel.

That Galaxy amp had some sort of transistor-controlled biasing circuit,
but I can't remember the details. I don't think that it was like the
currently used RF-activated bias networks, where the tubes have negative
bias applied that shuts them off, unless RF drive is detected.

Back in the 1950's/60's (can't remember which) there was an amp design
popularized in CQ Magazine, and also in their SSB book; it was from a
British ham, perhaps a `G4', although I can't remember the rest of his
call. I believe that a pentode was used to control the screen voltage
of the amplifier tube (perhaps a tetrode?), and that applying RF to the
amp's input caused the pentode to cease `pulling-down' the final amp's
screen bias (from a high-resistance voltage source).

The common `thread', between the Galaxy amp, the RF-activated bias
scheme, and the `G4' amp, is that all of them made an effort to get
the benefits of low quiscent current, and yet also tried to gain the
low distortion advantages of high `idling' current.

Comments, relating to these, and similar, biasing arrangements would
be appreciated.

>a good antenna (if you could really build one)?
>
>Steven D. Kuo N8OPH

duckies and other shortened antennas usually have higher currents for
a proportionately smaller length of wire, hence higher I^2R losses.
This results in lower efficiency.

I think the gain of a duck is around -5 dBd. I suppose I could measure
my duck someday, but I suspect it's different for different models.

> does it have to be measured?

Power gain of an antenna is defined as "4 pi times the ratio of the
radiation intensity in a given direction to the net power accepted
by the antenna from a connected transmitter". The power gain is
usually taken in the direction of maximum radiation.

Relative gain is "the ratio of the power gain in a given direction
to the power gain of a reference antenna in its referenced direction".
The reference antenna can be any whose gain can be calculated or is
known. Typically, the relative gain is in reference to a lossless
isotropic source (the gain represented as dBi), or a dipole (dBd).
So, if you had an antenna that was 3 dBi, it would be three dB better
than an isotropic; 3 dBd would be three dB better than a dipole.

The maximum gain of an antenna can be calculated from G = eD, where
e is the total antenna effeciency, and D is the directivity. For many
pratical antennas, an approximate formula for the gain is:

G = 30000 / ab

where a = half power beamwidth in one plane
b = half power beamwidth in a plane at a right angle to the other

These half power points can be determined from the pattern of the
particular antenna.

To calculate gain using the formula G = eD, both the effeciency and
directivity must be known. The directivity for both quarter and half
wave antennas can be found in any good antenna theory text. The effeciency
factor is the product of: reflection (mismatch) effeciency, conduction
effeciency, and dielectric effeciency. The conduction and dielectric
effeciencies are typically determined experimentally.

I hope this helps.

> You should know better than to start things like this but.....
>
> ANTENNAS DON'T HAVE GAIN!
>

Well, not exactly. There is an antenna parameter defined as the power gain of an antenna, and it is simply the ratio of the radiation intensity of the antenna in a given direction to the net power accepted by the antenna from a connected transmitter (ratio is multiplied by 4 pi). Typically, the direction is taken to be for maximum radiation. Here, we are not referencing the gain to anything but the power into the antenna. This is really a true gain measurement of the antenna.

> However, since we need a way to relate, usually the 'referenced to
> a half wave dipole in free space' is left off and 'gain' or 'loss'
> is stated in decibels.

Most antenna gain specs are given in reference to either a dipole or isotropic radiator. This is more formally known as the relative gain of the antenna. In fact, you really need to be careful which reference is being used -- some manufacturers will cleaverly omit the reference to make their product look better!

> Keep in mind that the same power is radiated
> so to get more in one direction you must have less in another.

Correct -- gain of the antenna is closely related to the directivity. Gain also takes into account the antenna effeciency, as well as its directional capabilities.

207. DJ-160 MODS

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-08 08:30:59 UTC
From: ds1437%BROCK1P.BITNET@cornellc.cit.cornell.edu
Message-ID: <9106080531.AA20295@ucsd.edu>
Source record: 296174

The new Alinco DJ-160 Radio will receive between 137-174 Mhz, and transmit in the 2Meter band only (144-148Mhz). A simple modification to the radio will enable it to transmit in the full range it receives currently. I have not tested the output power on other frequencies (Due to my one and only watt meter getting fried) however I have tried setting a weather receiver a small distance away, and I did hear the radio in the receiver. To make the mod, the following must be done: (I assume that you have some experience with electronics and that you can tell a wire from a resistor, from a transistor)

1) Take the battery of the radio by lifting the battery release button. If you look at the bottom of the radio, there will be a metal plate that is held on with 4 small screws. Take this plate off, noting exactly how the clip was held on (like the slot for the battery release clip)

2) On the back of the radio there are two screws that hold the back of the radio on, take these screws out.

3) Now you should be able to lift the bottom part of the radio by the battery release button slightly apart. I was told that you should take the top knobs off, but I found that I didn't have to.

4) If you take the Battery Release Button and turn it about 90 degress, the button should come out easily. After you get the small piece of plastic that is the button, you should see a yellow wire behind where the clip was.

5) Take a small wire cutter and CUT this YELLOW wire. You should probably make sure that the wire doesn't have bare metal showing from a lousy cutter, because I don't think that grounding this wire to the case would be HEALTHY for your radio. :-)

6) After You cut this wire. Assemble the radio, and just before you turn on the radio, do a power reset by holding the FUNC button while turning on the radio. This will reset the radio to ALL of the factory set parameters. YOU WILL LOOSE PROGRAMMED FREQUENCIES that were programmed into the memory mode of the radio, so just write the frequencies down before proceding with the above instructions.

7) The radio should be just like new, except that the transmit will be enabled for ALL frequencies! GOOD Luck!

If you use these mods for ILLEGAL purposes, pity upon thy sole, for you do not belong in the ranks of Amateur Radio. This information is only supplied for Legal and Informational Purposes

only and I can NOT be held responsible for anything that you do with
this INFO. And if you are an idiot and screw up your radio by your own
stupididy, TOO BAD. I can't be held responsible for my own actions
anyhow, so as Brian@ucsd.edu would say, "So There!"

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

211. GEOMAGNETIC STORM WARNING - ALERT! - MAJOR SHOCK ARRIVED

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-09 01:47:16 UTC
From: oler@HG.ULeth.CA
Message-ID: <910608194716.27200158@HG.ULeth.CA>
Source record: 296089

/\

POTENTIAL GEOMAGNETIC STORM WARNING

UPDATED: 01:30 UT, 09 JUNE

/\

WARNINGS ISSUED OR IN PROGRESS:

- POTENTIAL MAJOR GEOMAGNETIC STORM WARNING
- POTENTIAL MAJOR SOLAR FLARE WARNING (PROTON)
- POTENTIAL SATELLITE PROTON AND PCA ACTIVITY ALERT
- POTENTIAL GIC ANOMALY WARNING

ATTENTION:

A major interplanetary shock has arrived (less than one hour ago) at 00:40 UT on 09 June. This could be the anticipated interplanetary shock from the very large major flare of 06 June.

Minor to major geomagnetic storming could follow shortly with possible periods of severe storm levels, particularly over the high latitude regions. Major geomagnetic storming is in progress at the present time.

Auroral activity may become observable from the low latitudes if this materializes into a major geomagnetic storm. Significant auroral storming is expected over the middle to high latitudes, particularly over the central to to northerly middle latitudes.

Very strong HF degradations could be observed if this disturbance materializes into the anticipated major geomagnetic storm. If major storming occurs, expect significant levels of fading, flutter, distortion and noise with high levels of isolated periods of absorption over the high latitudes.

VHF auroral backscatter conditions could become widespread if major storming develops as anticipated.

Conditions are not expected to improve over the next 24 hours. Some improvements should be noticed by 11 June (barring further major flaring, which is expected).

PLEASE SEND ANY REPORTS OF DEGRADED RADIO PROPAGATION CONDITIONS, SIGHTINGS OF AURORAL ACTIVITY, VHF BACKSCATTER COMMUNICATIONS OR OTHER ANOMALIES TO: OLER@HG.ULETH.CA (INTERNET), OLER@ALPHA.ULETH.CA (USENET), OR (SNAIL-MAIL) TO: SOLAR TERRESTRIAL DISPATCH, P.O. BOX 357, STIRLING, ALBERTA, CANADA, T0K 2E0. PLEASE INCLUDE THE DATE AND TIME (LOCAL AND UT) OF THE OBSERVATION, THE APPROXIMATE LATITUDE/LONGITUDE OF THE OBSERVATION LOCATION, AND A BRIEF

DESCRIPTION OF THE PHENOMENA OBSERVED. WE THANK ALL THOSE WHO TAKE THE TIME TO SEND IN OBSERVATIONAL REPORTS.

213. LOW LATITUDE AURORAL ACTIVITY WARNING - HIGH RISK!

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-09 01:56:34 UTC
From: oler@HG.ULeth.CA
Message-ID: <910608195634.272001c7@HG.ULeth.CA>
Source record: 296090

/\

LOW LATITUDE AURORAL ACTIVITY WARNING

UPDATED: 01:30 UT - 09 JUNE, 1991
VALID: 09 - 10 JUNE

/\

ATTENTION:

A major interplanetary shock arrived at 00:40 UT on 09 June. This event has been followed by major geomagnetic storming since the shock arrived (one hour ago).

A major auroral storm is expected to develope during the local evening hours tonight (08 June, local time) and may extend through to tommorrow night as well (09 June, local time).

Conditions should be very favorable for observing auroral activity. Lunar phase should not interfere until near morning twilight.

Auroral activity may be seen by observers in the central to possibly southern U.S.. Please report any auroral activity sitings to: OLER@HG.ULETH.CA, OLER@ALPHA.ULETH.CA, or by snail-mail to: Solar Terrestrial Dispatch, Box 357, Stirling, Alberta, Canada, T0K 2E0. We thank all those who take the time to send in reports.

** End of Watch **

214. QXX meanings (should be a FAQ)

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-09 02:50:15 UTC
From: schriste@uceng.UC.EDU
Message-ID: <1991Jun09.025015.10314@uceng.UC.EDU>
Source record: 296092

Hi,
I read the FAQ, and I don't think this is in there, so I ask...

Where can I find the meanings to all of the QXX "shorthand" keywords, preferrably in a text file? I know some Ham Radio books contain some of them, but I can't find one with all of them.

If this file exists, maybe it's FTP location should be put in the FAQ...

Steven

P.S. Next week I plan to take my NOVICE test (_with_ code, mind you). I am a EE, and I heard that you can keep taking the higher level tests the same day until you fail one of them. Who knows, maybe I'll get higher than NOVICE....

I am not familiar with this amplifier, but if it was like much of the other Galaxy equipment I repaired for friends, I hope it died a deserved death. It is had to imagine such a poor design if low IMD is your goal. Thank goodness at todays prices, it would probably be cheaper to find "real" transmitting tubes than re-tube this amplifier. Trying to get ten sweep tubes evenly balanced (and tamed for parasitics!) would be like herding 10 cats! ;-)

>Back in the 1950's/60's (can't remember which) there was an amp design

>amp's input caused the pentode to cease `pulling-down' the final amp's
>screen bias (from a high-resistance voltage source).

I believe this might be known as the G2MA amplifier - at least this is what Bill Orr, W6SAI, in the 20th ed. of his "Radio Handbook" calls it. A medium power beam tetrode or pentode is used as a clamp tube to control the screen voltage of the large transmitting tetrode. When RF is applied to the amplifier the clamp tube is biased off allowing the screen voltage to rise. The screen voltage to the final amplifier is usually obtained from a dropping resistor connected to the plate voltage. The effect is similar to the controlled carrier form of AM found on many early SSB rigs. With no drive, the final amplifier screen voltage is low and the tube has a very low idling current. This circuit is especially useful for tetrode and pentode, grid driven amplifiers.

With triodes, it is necessary to use negative grid bias to turn the final amplifier tube off. With many cathode driven designs (sometimes called grounded-grid, not always accurately) it is common to provide this bias as a positive cathode voltage. This can be obtained from an independent bias power supply, or by the self bias obtained by inserting a large value resistor in the cathode return. In either case, electronic bias switching may be

used to turn off this bias when RF drive is applied. Ham Radio magazine ran several good articles on electronic bias switching.

>The common `thread', between the Galaxy amp, the RF-activated bias
>scheme, and the `G4' amp, is that all of them made an effort to get
>the benefits of low quiscent current, and yet also tried to gain the
>low distortion advantages of high `idling' current.

This is a very worthwhile goal. The idle current of many amplifiers produces up to several hundred watts of dissipation with no RF input. This is heat that serves no useful purpose. From an efficiency standpoint, and from the standpoint of longer life for the amplifier components by keeping them cooler, it is worthwhile to reduce the quiescent current of the amplifier during the time it is not needed.

An even more important reason for electronic bias switching can be found when running CW in the full break-in mode. The final amplifier tubes when drawing the higher quiescent currents produce wideband noise that can interfere with the QSK receiver. Biasing the tubes to cutoff between the key-down periods pretty much eliminates this noise. High speed QSK CW operation puts some stringent requirements on the switching speeds of the electronic bias switch circuitry.

>Comments, relating to these, and similar, biasing arrangements would
>be appreciated.
>
>Paul Nix (WB5AGF)
>InterNet: nix%muppet.decnet@consrt.rok.com

Thanks for bringing this up, Paul.

While on the subject of linear amplifiers, I would like to refer net readers to two fine articles by Bill Orr, W6SAI, and William Sayer, WA6BAN, in the June and July 1967 issues of QST. This two-part article should be required reading for anyone considering building a cathode driven amplifier. At the end of the second article, they tantalize with the following note:

A number of unorthodox linear amplifier circuits have come into
vogue in the past decade (the "ZL-linear," the "Class C" linear,
he "G2DAF" linear, etc.), all of which utilize some form of
envelope modulation. A subsequent article will deal with these
interesting circuits.

To my knowledge, this article has never been published - at least in QST. I would love to see this article. Perhaps it was published in some other magazine. Has anyone seen it?

216. FT-209RH out of band receive

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-09 04:25:48 UTC
From: rnelson@watserv1.waterloo.edu
Message-ID: <1991Jun9.042548.24993@watserv1.waterloo.edu>
Source record: 296084

A friend of mine owns a FT-209RH handheld. He is interested in
mods to extend the receive range. We checked hamster.business.uwo.edu
and found 1 mod that was not very specific. He is also interested in
information on the range capabilities of the rig. If you can be of
any assistance to us, please send me e-mail to the address below.

217. SIGNIFICANT SOLAR FLARE ALERT - 09 JUNE - IMPACT EXPECTED

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-09 04:47:11 UTC
From: oler@HG.ULeth.CA
Message-ID: <910608224711.27200256@HG.ULeth.CA>
Source record: 296085

-- MAJOR SOLAR FLARE ALERT --

JUNE 09, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

A major class X12+/3B flare erupted from Region 6659 (N31E06) at 01:43 UT on 09 June. The event saturated the GOES sensors for approximately three to four minutes before beginning a very slow decay. This LDE event has not yet terminated (x-rays are slowly decaying and are presently near class M2.3 levels). The flare began at 01:34 UT, peaked at 01:43 UT and should end sometime near or after 04:45 UT.

A moderate intensity Type II sweep and a major Type IV continuum burst have been observed from this energetic event. The integrated x-ray flux of this event was high, at greater than approximately 1.31 (preliminary estimate). The location of this event was almost directly on the central solar meridian, at N31E01.

Region 6659 is continuing to experience growth and increasing complexity. An additional delta configuration has materialized in this region, which continues to exhibit very strong magnetic fields, high shear, and significant magnetic gradients.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

This major flare is well placed for producing high terrestrial impacts. Preliminary analysis indicates minor to major geomagnetic storming can probably be expected near midday (12:00 UT) on 10 June. There is also a moderately high risk for severe geomagnetic storming from this event.

A satellite proton enhancement is possible from this latest event. Protons may arrive between 07:00 UT and 09:00 UT on 09 June. Models suggest that protons in the greater than 10 MeV band may reach or possibly exceed 1,500 pfu at that time.

Further major flaring (X-class and possible proton flaring) is expected from Region 6659 over the next three to seven days. White light flares may also be possible.

** End of Alert **

218. TX/RX on Kenwood 851A ?

220. please post following in rec.radio.amateur.misc

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-09 11:06:33 UTC
From: wk@frc.maf.GOVt.NZ
Message-ID: <9106091106.AA01317@frc.maf.govt.nz>
Source record: 296094

Newsgroups: rec.radio.amateur.misc
Subject: DC/DC convertors and /P operation
Summary: suggestions for /P DC/DC convertor wanted
Expires: 9 July 1991
Sender: wk@frc.maf.govt.nz (Wilbert Knol)
Followup-To: rec.radio.amateur.misc
Distribution: rec.radio.amateur.misc
Organization: Ministry of Ag. and Fish., Fisheries Research, Wellington, NZ.
Keywords: DC/DC convertor

One of the problems associated with /P operation of my TenTec "Triton" 540
is voltage losses and battery droop.
My fully recharged battery goes as low as 11V8 at full load (18 A) while
roughly 1 V is lost in the Triton's power connector and cord, leaving less
than 11.8 V to operate from.
This causes regulator dropout, resulting in nasty 591 reports (the dreaded
UA0 syndrome) as well as reduced output.

This effect does not occur at output levels less than 30 W, however, on the
long path into Eu you can't always afford the luxury of a 5 dB loss so I
decided to attack the problem at the root and built a DC/DC convertor to
boost the supply voltage to a stable 13V5.

The thing I am currently playing with consists of 2 TMOSFETs (MTM15N50)
driven by a TL494 regulator. The FETs operate in push-pull, driving a
centre tapped coil. The inductive spike at the drains of the FETs is
discharged into a capacitor bank of 30,000 uF trough fast switching diodes.
The system works very well up to output currents of 15A DC, providing
13V5 +- 3 mV, running off that same battery. Not good enough though, the
rig draws 18 A in the peaks...

Any load exceeding 15 A and the convertor starts to loose the battle;
the duty cycli at the gates go up to their maximum of 50 % after a few
seconds and the voltage slowly drops to below the battery level.
The centre tapped inductor was robbed from a junked computer PSU and has
a self inductance of 2 x 274 uH. I suspected core saturation and varied
the switch frequency from 15 kHz through to 200 kHz but this did not make
the slightest difference.

I am thinking about using a different inductor. Are there any rules of the
thumb for calculating the L needed. Would TV line transformer cores be any
good, may be couple taped up to reduce flux density.
I read that single ended inductors are no good as they use only half the BH
curve.
Alternatively I could take the voltage off a secondary winding, what windings
ratio would I use?

Any serious suggestions to improve the situation will be appreciated, feel free to post or Email me at wk@frc.maf.govt.nz

221. Need help practicing code

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-09 11:13:34 UTC
From: nmr1248@venus.lerc.nasa.gov
Message-ID: <1991Jun9.174522.6615@eagle.lerc.nasa.gov>
Source record: 296098

Hello,

Earlier this month, I went for my General Class license. I passed the theory but failed the code. I had been using the ARRL Code Tapes and had my speed up to 13.3 wpm by the time the test date rolled around. The problem was that even then I had a hard time remembering or would mix up the following letters: F, J, L, Q, X and sometimes G and W. I was able to copy the numbers, punctuations and procedural characters most of the time.

My question is what is the best way to remember the characters so I'll be able to copy the harder ones as fast as I can copy E, T, A, N, etc. I still have the novice code tapes that takes you through each character one at a time. Should I start there, at 5 wpm and work up or should I just keep practicing at 13 wpm and hope that if I listen enough I will be able to copy the harder characters? Which way is the best way to remember these characters and/or which way has worked for you. Any help or info would be appreciated.

>No, you need a special PSK modem. TAPR sells a nice kit and the G3RUH is
>commercially available from Paccom in Fla and as a kit from Radiokit.

A small nit: the PacComm PSK modem is a licensed version of the TAPR modem,
with the valuable addition of an AGC circuit. I use one with my PK-232
and it works great, although you'll need the TAPR disconnect header kit
for the PK-232 to make interfacing easy (it can be done without the kit
if you're a real masochist.)

In article <39910056@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
]>So the
]>question is what kind of "gain" and radiation pattern do those "rubber ducky"
]
]I think the gain of a duck is around -5 dBd. I suppose I could measure
]my duck someday, but I suspect it's different for different models.

We made the following measurements in 1983. Each set of measurements is
relative to the first measurement in the set.

2 Meter HT - Normal Talking Position

Stubby duck: 0 dB
Rubber Duck: +3 db
5/8 HT Antenna: +14 db

2 Meter HT - on belt, right side

180 degrees from test ant 0 degrees
Stubby duck: 0 db ...
Rubber Duck: +18 db +23 db
5/8 HT antenna: +40 db +40 db

2 Meter Mobile
1/4 wave 0 db
5/8 wave +9 db (I can't explain this one - it shouldn't be
this much)

440 HT
1/4 wave 0 db
Colinear +2 db

440 Mobile
1/4 wave 0 db
Colinear +4 db

All measurements were made at 100 yards from a 2 meter 1/4 wave antenna
mounted at 20 feet. Instrument was an HP Spectrum Analyzer type 8558B.

226. Specs for RAMSEY 2 Meter Xcvr Kit/ Address&Phone-Ramsey

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-09 20:32:29 UTC
From: gibbonsj@iccgcc.decnet.ab.com
Message-ID: <4831.28524a0e@iccgcc.decnet.ab.com>
Source record: 296100
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,rec.radio.swap

Since I have had enough direct inquiries about the Ramsey 2 Meter transceiver,
I think a general post is in order.

The Ramsey kit is as follows:

2 Meter Amateur PLL Synthesized FM Transceiver - Model FTR-146

I paid $125 + tax at the Dayton Hamvention for it - I don't know if that was
a show special or not.

It is basically a 2 Meter radio with the following specs:

(This is taken from Ramsey Publication no. M146FTR - Kit assy and instruction
Manual for the kit - Copyright 1991 Ramsey Electronics)
(All rights, credits go to Ramsey Electronics...)
Hopefully I didn't insert any typo's...

Freq Range: 144.000 to 147.995 MHZ
(actually its 143.000 - 148.110 Mhz, but NOBODY would
transmit out of band! 8-])
Tuning: Diode programmable PLL synthesis
PLL Programming: 5 KHZ steps
Transmit Offset: Simplex, +600 KHZ, -600 KHZ
Mode: NBFM
Packet Operation: 5 pin DIN connector for TNC cable
Power: 13.8 VDC +/- 10% (negative grounding)
Current: 1.5 Amps Transmit
200 ma Receive (no signal)
Antenna Impedance: 50 Ohms
Microphone Impedance: 500-600 Ohms
T-R Switching: PIN Diodes
PTT Circuit: Solid State
Semiconductors: 4 IC's, 26 transistors, 25 diodes (plus programming diodes)
(and LOTS of inductors, capacitors and resistors!)

Transmitter:

Final Power Output: 4-6 Watts
Final Output Stage: MRF237 or equivalent
Modulation: VCO
Maximum freq deviation: +/- 25 KHZ., +/- 5 KHZ NBFM
Modulation Distortion: less than 5%

Receiver:

Circuitry: Double Conversion superhet
first IF: 10.7 Mhz
second IF: 455 Khz

Sensitivity: 12 db SINAD less that 0.35 uv.
selectivity: +/- 7Khz (-6db)
+/- 15 Khz (-60db)
4-pole crystal filter at 10.7 Mhz

Squelch sensitivity: less than 0.25 uv.
Audio output: More than 2.0 Watts (!)

Its basically a TRUE Amateur Radio hobbyist's radio.

Where to get one you ask? Well...

Ramsey Electronics, Inc.
Amateur Radio and Hobby Kits Department
793 Canning Parkway
Victor, New York 14564

Phone: (716)924-4560 FAX: (716) 924-4555

No, I'm not an employee of Ramsey, nor am I getting anything for sitting at a terminal on a Sunny Sunday Afternoon and typing this. I just think that this is a GREAT radio kit and a lot of fun to build and use!

RTTY DX Notes for week ending 7th June 1991
BID: $KT7H158
Part 1 of 3.

I feel that I have been terribly remiss over the past weeks, in that I
should have been reminding you of the ANARTS RTTY DX Contest this
weekend, 0000Z 8th June until 2359Z 9th June. This is a digital mode
contest, RTTY, AMTOR and PACKET are allowed. The message is Zone,
Time (GMT) and RST.

Score per the old CARTG score sheet (or send in the log and we will
cheat for you (oops). Multiply by countries multiply by continents.
The contest manager is VK2EG, 55 Prince Charles Road, Frenchs Forrest,
2086 Sydney, Australia. See you in there.

Our thanks this week go to G0ABI, I5FLN, NT3B, OD5NG, TG9VT, VK2EG,
W2FG and the DX Packet Cluster Network, and W4FJ. Thank you all for
your assistance in putting these notes together.

RTTY DX Notes for week ending 7th June 1991
BID: $KT7H160
Part 3 of 3.

QSL Information.

YI1BGD requests his cards to be sent to Box 7477, Baghdad.

VP5JM indicates that W3HNK will be her QSL manager as soon as it can be arranged.

SN0PJ will QSL via SP4KM.

RB0HZ seems to live in Box 117, 314000 Poltava, Ukraine, USSR.

The correct QSL address for KG4DD is Don Donley, Box 692,
FPO New York, NY 09593-0055

Notes of Interest.

Market Reef. OH2AP/OJ0 and 5 other operators will be active from 7th June until 15th June. QSL via OH2AP. Also, SI8MJ will be active at the same time from the Swedish side of the reef. QSL to his home call of SM0RBO.

SN0PJ is a special call for the second visit of the Pope to Poland. For QSL see QSL info.

The ARRL has advised that Penguin Island will count as a new country. Hold cards until after September 1, 1991.

UA3AKR has returned home after the M.V. Island stint and says that they had over 1000 digital QSOs, 815 were on RTTY. The expenses for the trip were higher than expected, and they request some donations to be sent to the QSL manager, OH2BU.

HK3DDD has received 1700 cards of the 50,000 ordered from the printers for the HK0TU operation. We hope that he will now start to send cards to the very patient people who worked them.

GL DE DX1.

This bulletin is the packet edition of the RTTY DX Notes written by VK2SG, and is edited and relayed by Tad, KT7H @ N7DUO.WA.USA.NA.

> the QST table of contents to be a blatant commercial advertisement?
> - Brian

Well, in the STRICTEST sense, yes, it is use of NSFNET resources (as well as UCSD resources, whose computers support the Info-Hams mailing list gateway of this newsgroup) for commercial purposes. Realize that although the ARRL is non-profit, it does derive commercial revenue from QST advertisements (and pays taxes on that revenue).

HOWEVER, I think there are several points of mitigation:

1. The posting of the Table of Contents is for information/educational purposes well within the spirit of this newsgroup. The ARRL is not going to make much more money by selling a few more copies.

2. The posting is done via a UUCP feed to computers at the University of Hartford, which I'm sure takes the position that this is legitimate educational use of Internet resources (this implies that the NSF doesn't see a problem with it either)..

The guys at HQ mean well, and the posting is meant in the spirit of pointing to yet another source of information. In summary, I think its OK and should continue.

229. MINOR GEOMAGNETIC STORM ALERT AND INFORMATION UPDATE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-10 02:23:42 UTC
From: oler@HG.ULeth.CA
Message-ID: <910609202342.272003c4@HG.ULeth.CA>
Source record: 296105

/\

GEOMAGNETIC STORM ALERT

/\

Issued: 02:00 UT, 10 June

ATTENTION:

A minor geomagnetic storm has been in progress since 00:40 UT on 09 June. The activity has been rather weak in nature.

Another weak interplanetary shock was observed at 16:15 UT on 09 June, which measured only 15 nanoteslas (nT). It was followed by a weak increase in geomagnetic activity.

An interplanetary shock from yesterdays large X12+/3B flare is expected to arrive sometime near 12:00 UT on 09 June. There is uncertainty regarding the possible impact of this shock. We believe the ensuing geomagnetic activity will remain at minor storm levels with possible periods of major storm level excursions. Major to severe geomagnetic storming is not expected, but can't be entirely ruled out due to the uncertainties which exist.

The satellite proton event continues in progress. A gradual decay in the proton flux began near 17:00 UT on 09 June and is continuing at the present time. The proton flux at greater than 10 MeV is currently near 70 pfu. The satellite proton event is expected to continue for at least the next 24 hours. Further major flaring could enhance these levels significantly.

The Polar Cap Absorption (PCA) event weakened significantly following the large shock which occurred early in the UT day on 09 June. Absorption levels are also decaying in tandem with reduced proton activity. The PCA is technically almost over, although renewed activity can be expected should another major flare erupt.

Solar activity has been moderate to high over the past 24 hours. Several minor M-class flares occurred following yesterdays powerful class X12+/3B event. The largest minor flares occurred at 13:19 UT and 20:05 UT on 09 June. Both of these events were class M1.3 flares. Another major flare is expected to occur within the next 24 to 48 hours. Region 6659 is extremely complex. Significant shearing is taking place in this region, which now spans an area well over 6,000 million square kilometers. A strong delta configuration continues in this region.

The Low Latitude Auroral Activity Warning will remain in effect for another 24 hours. If an interplanetary shock fails to arrive from the large X12+/3B flare of 09 June, the Warning will be downgraded to a Watch. This continues to be a high-risk period.

HF propagation conditions will continue to remain only fair to good throughout the next 24 hours. Some improvements in polar propagation has been observed recently, although conditions are still well below normal there. Full ionospheric recovery is not expected until later this week at the earliest (barring further major flaring). Degradation can be expected on 10 and possibly 11 June. Some recovery should occur later in the UT day of 11 June and 12 June. Further strong solar flare activity could continue to produce occasional major shortwave blackouts and strong SIDs.

There will be a chance for VHF auroral backscatter on 10 June and the early part of 11 June. This is dependent on how strong the terrestrial impact is from the major flare of 09 June. There is uncertainty regarding how strong the impact might be. At the present time, we continue to believe the impact will be moderate, although probably won't be sufficient to produce widespread backscatter opportunities.

** End of Alert **

230. VHF auroral backscatter

231. APT-Sats: Status JUNE 09, 1991

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-10 07:35:15 UTC
From: henne@eana.f3.gmd.dbp.de
Message-ID: <4883@gmdzi.gmd.de>
Source record: 296107

Observed at station 50.7 NLat, 7.1 ELon , JUNE 09, 1991

NOAA-9: APT 137.62 *OFF*
NOAA-10: APT 137.50 On
NOAA-11: APT 137.62 On, BCN 137.77 On
NOAA-12: APT 137.50 *OFF*
last APT observed JUNE 02, two vis-channels
METEOR 2-19: APT 137.85 *OFF*
last APT observed JUNE 02, 1991
METEOR 2-20: APT 137.85 On, only image!
METEOR 3-4: APT 137.30 On

AOS of NOAA-12 should be now 6 Minutes after AOS of NOAA-10,
difference increases, orbit-plane difference is some degrees and
increases slowly. So if anything works normal we may expect
NOAA-12 to be active again in the near future.
METEOR 2-19 is drifting towards early morning and switched off.
Activity was taken over by METEOR 2-20 (N->S afternoon). Good
images, but *NO* burst, greyscale and digital bars.

No other APT was active 136.00 to 137.99 MHz.

>
The article appeard in February or March (I thin') 1966. The amplifier you
describe is the G2DAF circuit. In that circuit two 6X4 's (I used a 6BY5)
were used in a voltage doubler circuit and developed about 350 volts from the
incoming RF and applied it to the screen grid of a pair of 4-400 transmitting
tubes. Since the amplifiers grid was above ground the idling current was about
90 MA @ 3000V, about half of what it would be in gronded grid operation. Since
the screen voltage varied with the incoming signal the amplifier started in
Class A and went thru classes AB1 and AB2 and eventually winding up in Class B.
>
>The common `thread', between the Galaxy amp, the RF-activated bias
>scheme, and the `G4' amp, is that all of them made an effort to get
>the benefits of low quiscent current, and yet also tried to gain the
>low distortion advantages of high `idling' current.
>
This type of operation is suspect from a linearity point of view. Others
(WB3GCG) who have built this amp claim that the inter-mod was not so hot,
definitely not anywhere near the quality of simple GG amps using todays modern
tubes, ala 8877, 3CX1500, etc.. From my experience the major advantages of this
circuit are a) a center-tapped filamment xfrmr was not required hence no
filament choke, b) low RF drive, an HT37 w/75 watts out was sufficient to
and c) low idling current, hence less heat in the shack.

From: plymale@groupw.cns.vt.edu
Message-ID: <1894@vtserf.cc.vt.edu>
Source record: 296114

I recently acquired an Icom IC-24AT HT. While setting a
frequency with the tuning control, I noticed that the
memory channel readout on the LCD display contained the
letter "U". Further investigation showed that the "U"
appears only when tuning between 130.48 - 138.42 MHz.
I've enabled the extended range receive feature (LIGHT + B + #).
A friend of mine has observed the same behavior on his IC-24AT.
Has anyone else seen this and does it have any special meaning?

Thanks,

Bill Plymale

>be? My main interests are promptness and merchandise which is in perfect
>condition upon arrival to my home. Also, should I insure my check? It's
>a personal check.

Both are reputable companies who's business depends heavily upon mail order; therefore expect about equal treatment.

Promptness is a function of inventory, about which you should have inquired. It is also a function of their policy regarding your personal check clearing the bank before they will ship! A week to two weeks delay is not uncommon.

My advice, which is worth what you paid for it, is to order the unit using a credit card for which - if the merchandise is damaged or misrepresented - you have certain legal rights and can refuse to pay the bill AND have the credit card company helping you with the vendor -- if you have a problem. Also, some cards like American Express and VISA GOld provide all risk merchandise insurance for sixty to ninety days.

Next best bet is COD - to be paid for with a cashier's or certified check upon arrival. COD may cost a few more bucks, but you have the opportunity to inspect the packaging for external signs of damage in transit before you hand over the check. Have the vendor telephone you with the total - including shipping charges and COD fee, when shipped. If shipped UPS, they will also call the day before delivery and tell you how much is due -- so you can get to the bank and have the check ready for them.

Both of the above methods obviate the need to consider insuring your check. However, if you should choose to send a certified or cashiers check by mail to purchase the unit, it might be worthwile insuring it. Cashier's and certified checks can be tedious instruments to stop payment upon - YOU must prove fraud or theft - difficult to do when stolen or lost in the mail!

The questions I have are: Would it bother you less if the ToC were being posted by someone other than a paid ARRL employee, and if so, why? (That is, is it the information that bothers you or just the source?)

And would it bother you less if other ham magazines did the same thing? If so, perhaps we should encourage them to do so. (I'd sure find it useful!)

Believe it or not, I don't sit up nights figuring out ways to entice the net readership to join ARRL. What I *am* trying to do is put something back into the net to "pay" for the value we receive from our access to the net. Since what we have unique access to is information about ARRL, including QST, and since I think a large percentage of the net readership wants such information, that's what we provide. If some see that as self serving, so be it.

>hahn@uclapp.physics.ucla.edu

The following is not an endorsement, but I have had success with the
following mail order company:

MCM Electronics
800-543-4330 in USA except Ohio
800-624-3908 in Ohio
800-824-9491 in Canada

Open during week from 7:00 AM to 8:00 PM EST.
Open Saturday from 9:00 AM to 5:00 PM EST.

They have components, phone stuff, CATV, test equipment, audio
components, microwave and VCR parts, flybacks, American/Japaneese
transistors/chips, xformers, wire, belts, tape heads, phono parts,
speakers, alarms, switches, connectors, fuses, batteries, chemicals,
computer accessories.

Call'em and get a catalog. They have a minimum order ($20 or $25)
but get the catalog and you'll find other stuff you need to reach the
minimum. Their audio cables are about 1/2 to 1/3 the price of what
R____-S____ sells them for.

They have a belt gauge in their catalog that will help you select the one
you want. I don't have their catalog with me at the moment so I can't get
into any particulars. Keep your old broken belt so you can measure the
length of it... also note if the old one is square, flat or round.

241. LOW LATITUDE AURORAL ACTIVITY WARNING UPDATE - 10 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-10 15:52:56 UTC
From: oler@HG.ULeth.CA
Message-ID: <910610095256.272004ce@HG.ULeth.CA>
Source record: 296032

/\

LOW LATITUDE AURORAL ACTIVITY WARNING

UPDATED: 15:30 - 10 JUNE, 1991
VALID: 10 - 11 JUNE

/\

ATTENTION:

An interplanetary shock from the large class X12+/3B flare arrived at the earth near 07:00 UT on 10 June. Major to severe geomagnetic storming promptly followed. Activity has continued at major storm levels since then. A major auroral storm developed during this period and is in progress at the present time.

There is a relatively high risk for low-latitude auroral activity being observed over the next 24 hours. Conditions have materialized which may be favorable for lower latitude auroral observations.

These conditions should remain for approximately the next 18 to 24 hours. By 12 June, conditions should decay and become unfavorable for low latitude auroral observations.

** End of Watch **

>
> You should know better than to start things like this but.....
>
> ANTENNAS DON'T HAVE GAIN!
>

One thing that should be pointed out is antenna gain plays
an important role when performing link calculations or using
the radar range equation.

Link calculations are used to design a point to point radio system.
Various gains and losses of the system are accounted for: transmitter power,
transmitting antenna gain, path losses, receiving antenna gain, etc...
The goal is to design a system so that dependable communications will
exist (i.e. meet a given bit error rate in a digital link). When
performing these calculations, both the transmitting and receiving
antenna gains are included in the calculation. In fact, in order to
meet system requirements, it is possible to choose an antenna with a
higher gain.

The Friis transmission equation also uses the transmitting and receiving
antenna gains to come up with the ratio of received power to
transmitted power.

So...there really is an important property called antenna gain.

243. GEOMAGNETIC STORM UPGRADED TO MAJOR CATEGORY - 10 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-10 16:01:58 UTC
From: oler@HG.ULeth.CA
Message-ID: <910610100158.272005cc@HG.ULeth.CA>
Source record: 296029

/\

GEOMAGNETIC STORM ALERT

/\

Issued: 15:30 UT, 10 June

ATTENTION:

The minor geomagnetic storm has been upgraded to a major category storm.
The interplanetary shock from the large class X12+/3B flare arrived near
07:00 UT on 10 June. Major to severe geomagnetic storm promptly followed.
Conditions are currently at minor to major storm levels.

Activity is expected to remain at minor to major storm levels throughout
the next 18 to 24 hours. Some decay can be expected thereafter.

A major auroral storm began near 07:00 UT on 10 June and is in progress
at the present time. Auroral activity is expected to become intense enough
to be viewed over some lower latitude regions.

Significant degradation in HF propagation conditions has occurred and is
expected to continue for the next 24 to 48 hours. Some improvements can
probably be expected by 12 June, although a full recovery will not likely
occur this week.

Probabilities are high for VHF auroral backscatter communications.
Conditions are fairly favorable for backscatter on the VHF bands. For best
results, use directional antennas pointed low in the north or northeast
horizon (below 10 degrees in elevation). CW transmissions stand the greatest
chance of making it through the auroral-induced flutter.

** End of Alert **

Hello,

I just recently received my no-code technician license from the FCC
(6 wks wait time, for those keeping score..)

Being a new ham, I've got oodles of questions that I want to ask,
but rather than ask the whole net what are probably often repeated
dumb questions, I'd like to correspond via e-mail with anyone who
might be interested in being an e-elmer for me, so to speak :-)

Prospective e-elmers take note:

I'm very interested in packet, esp. running TCP/IP,
also, if any of you are located in the Baltimore area
that would be a fantastic plus!

Now, some questions for the group in general:

I'm looking to buy a 2m mobile rig for my car. What do you recommend?

So far I've seen (in person) a Kenwood TM241A, an Ad for Yeasu 2400FT
and a CQ review of ICOM 229H.

These all sound like very good comparable rigs, any opinions on them ?

Also, to go with whatever 2m mobile I end up getting, I will need an
antenna.. any recommendations ? is 5/8 better than 1/4 wave ?

Do they make telescoping 'power' 2m antennas that I could replace my current
am/fm stereo one with ? I have seen such beasties for CBers.
This would be a great feature, as I don't want to have anything visible
outside my car which could encourage thieves (already had one car stolen
in the city..)

Also, I've noticed that VOX headsets are not offered as options on
mobile rigs, although they are available for HTs .. any ideas why not ?

(I realize it is illegal to wear headphones while driving, but it
is legal as long as ONE ear is not covered (at least in MD))

That's enough questions for now, I'll sit back and watch the sparks
fly for awhile.... :-)

Anyone who would like to e-elmer me or answer any of the above
questions, please drop me a line at mark@cogsci.cog.jhu.edu

Thanks for your time..
-Mark, N3JLP (Jean-Luc Picard... :-))

They sure did. My first novice transmitter was a Globe Chief 90A. Had a pair
of 807s in the final. It would also work AM but it was not plate modulated
like the DX-100. It also required < 3 people to pick it up :-). I latter
sold it and bought a used DX-100. Great transmitters.

the rest of his questions. Ed.

Steven,

Every ham-radio magazine has done QRP CW rig construction articles. If
you send an SASE to the ARRL Technical Department Secretary, Tammy will
send you a free (about 6 pages) bibliography of QST construction
projects. Ask for the Basic Construction bibliography. We can supply
reprints or back issues for these articles.

Many companies also make suitable kits. I recently did a posting that
listed companies that sell kits. If you missed it, the Technical
Secretary can send you a hard copy, or you can email me and I will
send it via the net. If I get a lot of requests, I will post it
instead, so keep up with the news.

Our book, QRP Anthology, consists of reprints from QST that are of
interest to to the QRP operator. There are several CW transmitter
construction articles.

GC Electronics, 400 S Wyman St, Rockford IL 61101, (815) 968-9661, makes
a line of replacement belts. These are usually distributed through the
electronic distributor that sells to the electronic repair shops in your
city. You should have no trouble finding one in LA, either consult the
Yellow Pages or ask your TV/stereo repair shop.

GC will probably also be able to refer you to the nearest distributor.

If you email me directly, I will send you a photocopy from the GC
catalog to get you on your way. Include your US mail address, and a
brief description of what you need to refresh my memory. GL, 73, Ed.

Source record: 296117

nmr1248@venus.lerc.nasa.gov has trouble distinguishing certain letters ...

Others are right when they say that if you're thinking about which letters are which, you're going to plateau a bit under 13 wpm. The most common problem comes from doing a double translation: sound to dots and dashes, then dots and dashes to letters.

It's possible that a firm grounding on "which letter is which" is necessary before trying to increase your speed. So I second the suggestion to make up practice sessions that only contain two or three of the letters you're interested in.

And being fond of mnemonics, you might think of 'L' as "to ELL with it".

If you can find a mnemonic for your difficult letters, it will help you get a firm grip on which is which, but it will inhibit your speed progression. So consider that you really need to back up a little.

Then you'll go forward faster. :)

249. MAJOR SOLAR FLARE ALERT - 10 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-10 18:10:12 UTC
From: oler@HG.ULeth.CA
Message-ID: <9106101210 12.2720072a@HG.ULeth.CA>
Source record: 296039

-- MAJOR SOLAR FLARE ALERT --

JUNE 10, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

A major class M6.4/1N flare occurred at 13:58 UT on 10 June. The flare was located at N32W14 and was associated with fairly strong initial radio bursts. A Type II sweep was observed from this event, but does not appear to be associated with a Type IV. This event was rather impulsive. The event began at 13:51 UT, peaked at 13:58 UT and ended at 14:13 UT.

Region 6659 continues to pose a major threat. Solar activity from this region has been high over the past 24 hours. A significant flurry of M-class flare activity has developed and is expected to continue for the next 24 hours.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

This last major class M6.4/1N flare is not expected to have a significant terrestrial impact. A light to possibly moderate impact is possible, but will probably be confined to the "low" category if an impact materializes at all.

Proton levels are currently running between 60 and 80 pfu at greater than 10 MeV. PCA has also increased over the past several hours, although this increase is expected to be only temporary (barring a major proton flare). There is an approximate 50% chance for a significant proton flare over the next 24 to 72 hours.

Solar activity will remain high. M-class flaring and isolated major X-class flares are possible and are expected over the next three days from Region 6659. Terrestrial impacts could be high given further major flares. High-energy events are possible from this region. White light flares may also be possible.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

Has anyone tried to use ATV equipment to send high speed digital information, along the lines of the "back up your computer disk on your VCR", by making a modem that outputs something that looks like a standard TV signal?

Should be good for over 4 Mbps, and if you work it right you can put your ID out as a visual signal.

>A friend of mine has observed the same behavior on his IC-24AT.
>Has anyone else seen this and does it have any special meaning?

This means the synthesizer is unlocked at that frequency. The
description for the "U" appears on the IC-02AT manual, but I
couldn't find any reference to it in the 24AT manual. I don't
think they mention it because the entire extended receive thing
on the 24AT is an undocumented feature.

Usually an unlocked synthesizer results in the radio being
unable to receive a signal on that frequency because it can't
generate the IF. Mine will very occasionally, however, still
receive even when the display has the U in it. My guess for this
is that the processor sees the "unlocked" signal from the PLL
but it is still close enough to pull in the signal. This is down
in the aircraft band so I'd imagine the synthesizer frequency
wouldn't need to be so critical to detect an AM signal, which is
what aviation transmissions in that band are.

252. a Pro-2005 mod

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-10 19:01:37 UTC
From: mrk@spretus.jax.ORG
Message-ID: <9106101901.AA07097@spretus.jax.org.jax.org>
Source record: 296120

I'm trying to make my Radio Shack Pro-2005
scanner programmable from a IBM XT.
The scanner detects keystrokes by sending
pulses out on 7 lines and watching for results on
4 lines. So, I figure that by
combining a 8 to 1 multiplexer
with a 8 to 1 (okay, 4 to 1) demultiplexer,
I can implement a player piano type interface.

I bought a prototype card and wired up
a few latches to hold the addresses
of the lines I want to cross. I
hook the 7 lines from the scanner CPU to a 74LS151,
take the NOT output from the '151
to the input of a 74LS155 configured as a
1-to-8, run the output lines of the '151 through
a 7404 inverter (because the scanner expects its input
to be normally low), and, finally, I've got
4.7K pullup resistors on the inverter outputs,
because I think my TTL high level isn't high enough
for the CPU.

Things work fine if I just put a signal
on an input line, tell the board to cross
that input with an output, and watch the output.

But it doesn't work when I hook it up to the scanner,
When the scanner sees a high on an input line,
it pulses each of its normally high outputs to
ground. When I hook up my board, however, the
pulse looks like it only drops about halfway to ground.

The scanner service manual says the CPU is a
"GRE-0725", but I don't know if that's
TTL or CMOS or what. Is there such a thing
as a pulldown resistor for interfacing whatever
a GRE-0725 is to TTL? Is the CPU simply incapable
of driving TTL?

Thanks in advance.

>And since those who are interesed can easily calculate
>N.F. and 3rd-order intercept from the data given, I really don't understand
>the basis of the complaint.

The basis of the complaint is that it makes comparing receivers more difficult. Noise figure is a fundamental measurement of how good a job the receiver designers did in designing a low-noise front end. Yes, you can calculate it from MDS assuming the report gives you tha bandwidth, and assuming the "bandwidth" given really does approximate the noise bandwidth. I have been frustrated several times when faced with receiver comparisons (not just from QST) that someone had put a lot of effort into, but not enough data was given to be able to do a valid comparison.

Similarly, yes you can calculate TIO given dynamic range and MDS. You also have to know the formula the author used for calculating dynamic range. (There are several different methods.) But TOI is a much more fundamental measurement of receiver strong-signal handling capability since it does not depend on IF bandwidth.

Message-ID: <1991Jun10.204424.26278@swbatl.sbc.com>
Source record: 296044

Have any other Ten-Tec Paragon owners on the net noticed that the real time clock speeds up rather badly when the radio is "on"? When the power is "off" it keeps accurate time. I called Ten-Tec and they attributed the problem to thermal drift and had had no real complaints. I thought gaining 1/2+ seconds per hour was a bit much and kept digging.

To make this story short, uP noise was driving the clock chip nuts and a little by-passing did the trick. Now I have an accurate clock- radio on or off. I'd like to verify this with others prior to making a fool of myself in front of T-T engineers. It may have just been my radio, or, I may be the most particular person in the world

E-mail if you want details.

I have never even seen an IC-24 but... on the IC-03, IC-04 and the U-16
(commercial Icom HT) a "U" in the upper left (as I remember) corner of the
display indicates that the synthesizer is unlocked. On some of the earlier
radios the transmitter was *not* disabled during this condition. On newer
ones it seems to be.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
Sunday, June 16, 1991
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 400 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $1.50 (you get 50c off if
you're lucky enough to have a copy of our add)
and sellers spaces are $8.00-each at the gate
or $5.00 if mailed by the preceding 5th.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

In article <1894@vtserf.cc.vt.edu> plymale@groupw.cns.vt.edu (Bill Plymale) writes:

I recently acquired an Icom IC-24AT HT. While setting a
frequency with the tuning control, I noticed that the
memory channel readout on the LCD display contained the
letter "U". Further investigation showed that the "U"
appears only when tuning between 130.48 - 138.42 MHz.
I've enabled the extended range receive feature (LIGHT + B + #).
A friend of mine has observed the same behavior on his IC-24AT.
Has anyone else seen this and does it have any special meaning?

The 'U' means that the PLL circuit is "Unlocked". I would assume that
the recieve frequency is not stable and may not correspond to the dial
frequency.

I have noticed that different models unlock at different places. I
think mine unlocks around there and then is pretty good up to almost
950. Even when it shows U it seemd to recieve OK for a 950 something
wireless mike.

I believe that if you tweak some stages of the radio that you can
change this characteristic but that would presumably alter the
specifications for the ham bands.

262. what mods are needed for the PRO34 scanner?

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-10 21:55:53 UTC
From: pattersn@motcid.UUCP
Message-ID: <7303@jade5.UUCP>
Source record: 296037

Does anyone know how to modify the Realistic PRO34 scanner
in order for it to scan the 'locked-out' frequencies (e.g. cellular bands)?

I think it's just a matter of pulling a diode or putting in a
jumper or something.

Would anyone know where I could obtain this information?

Thanks

I have exactly the same problem on my BC100XLT. Come to think of it, my Radio Shack (Realistic) TRC-216 CB Walkie Talkie also has this problem (But the indicator is a non-flashing type)! Oh well. I like my Kenwood TH-75 better anyhow.

Anybody have any information about these problems?
If so, I would love to hear from you!

Thanks, and 73!

** End of Quote **
Sure can do...its not that hard...look inside and see what type of PLL chip is in there..if it is a PLL 02A then all you have to do is change the 37Mhz xtal to a 39 or whatever you wish channel 1 to come up on.....73 had a lot of articles on these conversions a few years ago...check with them and they might have the article on the particular rig you own (you didnt mention WHICH Midland rig it is....)DODoe it have SSB or is it AM only and how many channels?? A 40 Ch AM only rig might be better to convert to FM on the 29.4 to 29.7 range....the AM guys are from 28.8 to 29.2 or so....SSB would be 28.300-whatever the upper edge would be (28.7 or so would be reasonable with a 40channel rig)....I have worked 10mtr with several converted 11mtr rigs!
Gud Luck!

10th ANNUAL SEDS INTERNATIONAL CONFERENCE

-=+=- Call for Papers and Participation -=+=-

August 10-14, 1991 Sheraton Old Town Hotel Albuquerque, New Mexico

Sponsored by the University of New Mexico Chapter of
Students for the Exploration and Development of Space (SEDS).

Theme: "Education - The Key to the Cosmos"

Topics: Small satellite research, space life sciences,
lunar-based astronomy, manned missions, space power and
propulsions systems, space exploration, and education.

Papers on any of the above topics should be sent to
the address listed below and received no later than July 15, 1991.

Speakers include:

Prof. Mohamed S. El-Genk
Institute for Space Nuclear Power Studies, UNM

Dr. William K. Douglas
NASA Flight Surgeon, Project Mercury

Theresa Foley
Editor, Space News

Nikolai N. Rukavishnikov
Soviet Cosmonaut and Buran/Energia Engineer

PLUS

Students from the United States, Canada, United Kingdom,
Soviet Union, Uruguay and more...

Tours: Sandia National Laboratories, University of New
Mexico, the SEDS Satellite Tracking Station, and
the New Mexico Space and Planetary Image Facility.

Events: Barbeque, Educator Short Courses, Awards Banquet
and continuous demonstrations of weather satellite
image capture, amateur radio satellite communications,
satellite TV links, and voice/computer contacts with
the Soviet space station MIR.

Exhibits: Government, industry and international participation.
Exhibit space is still available.

$60 registration includes banquet, barbeque and tours.

For additional information, please contact:

Brian Vanden Bosch, Chairman
1991 SEDS International Conference
Box 92 SUB, University of New Mexico
Albuquerque, NM 87131

Phone: (505) 277-4845
Fax: (505)277-0813
Electronic mail: seds91@hydra.unm.edu

I've had good luck using MCM Electronics, 800-543-4330. They'll send
you a catalog full of all sorts of interesting, fairly priced goodies
including belts, idlers, etc. for the repair of VCR's. I've fixed a lot
of things using belts and idlers with the help of MCM!

267. VERY SIGNIFICANT MAJOR SOLAR FLARE - HIGH IMPACT EXPECTED

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-11 06:41:47 UTC
From: oler@HG.ULeth.CA
Message-ID: <910611004147.272009df@HG.ULeth.CA>
Source record: 296040

-- MAJOR SOLAR FLARE ALERT --

JUNE 11, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

A very powerful solar flare ripped out of Region 6659 on 11 June. The event began at 01:56 UT, peaked at 02:09 UT and ended at 04:40 UT on 11 June. This event saturated the GOES sensors. The x-rays surpassed the class X12 level for approximately 4 to 8 minutes before beginning a very slow decay. The optical component was rated 3B. The flare was located at a sensitive position of N31W20. This class X12+/3B tenflare remained in the X-class category for almost one full hour. The rate of decay was very gradual, as can be seen by the end-time of the event (almost 3 hours from start to end).

This event is a very significant one. Energetic protons at greater than 100 MeV were observed shortly after the peak x-ray flux was observed. Protons at greater than 100 MeV peaked at 18 pfu at 05:25 UT. Current levels are near 16 pfu at greater than 100 MeV. Protons at greater than 10 MeV skyrocketed from about 10 pfu at 02:30 UT to 980 pfu at 05:15 UT. 10 MeV protons are currently fluctuating around the 340 to 380 pfu level.

A major importance 3 Type II sweep and a major importance 3 Type IV sweep were observed from this event. Strong radio bursts have also been observed (most of which are still in progress). The 15400 MHz burst was measured at 28,000 sfu, while the 245 MHz burst was measured at 7,500 pfu. Please note that this is preliminary data and may not be entirely accurate.

The integrated x-ray flux from this event was high, rated at 1.80 joules per square meter. Concurrent with this major flare was a severe geomagnetic excursion. The combined effects of the major to severe geomagnetic storming with the high-intensity x-ray levels produced a major HF blackout locally despite the low solar zenith angle. Widespread HF blackouts have been observed.

A polar cap absorption event (PCA) has recurred with this most recent energetic event. Preliminary data indicates absorption levels are fluctuating around the 4 dB level.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

This class X12+/3B tenflare will have a major to severe terrestrial impact. The impact from this flare could surpass the intensity of the

present disturbance (which is very near severe levels).

A Major to Severe geomagnetic impact is expected anytime near or after 06:00 UT on 12 June. Conditions are expected to remain at major to severe storm levels until 14 June, when conditions should begin to fall to active to minor storm levels (again, barring additional powerful flaring).

A Major to Severe auroral storm is expected to accompany this major interplanetary disturbance. There is a very high risk (>70%) for significant low-latitude auroral activity on 12 June and 13 June. The highest probabilities for low-latitude auroral activity will occur on 13 June, with a smaller chance (~ 45%) for residual low-latitude activity on 14 June. June 12-14 (centered on 13 June) represents a very high risk period for low-latitude auroral activity.

A very strong HF radio propagation impact is expected to accompany this major disturbance. Despite the fact that we are presently experiencing significant HF disruptions from the present disturbance (which was caused by the less powerful X12+/3B flare of 09 June), conditions are expected to become further disturbed when the interplanetary shock from this last major flare arrives on 12 June. Widespread HF blackouts may accompany this disturbance on 13 June.

A very high probability (> 80%) for VHF auroral backscatter communications will exist for 13 June. We are presently experiencing conditions very favorable for VHF backscatter. Conditions should become most favorable on 13 June. High latitude regions are not expected to have particularly good opportunities for VHF backscatter. This activity is expected to dominate over the middle and low latitude regions (particularly the middle latitudes).

The ionosphere will not recover to significantly useful levels throughout the remainder of this week. It will require several quiet days to strengthen to levels useful for reliable long-distance communication, and these quiet periods are not expected to occur for the next 7 to 10 days.

Further major X-class flares are possible from Region 6659, although over the next 24 hours, predominatly minor M-class flares should be observed. High energy events are possible from this Region. White light flares may be possible.

** End of Alert **

268. DX Bulletin

Newsgroup: rec.radio.amateur.misc

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 014 (OPDX.014)
June 10, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, WK3N, WB3LHD, KA5EJX, KQ8M, K8KAE and K8YSE for the following DX information.

1A0, SOV. MIL. ORDER OF MALTA. Tony, I0IJ, QSL Manager for 1A0KM, reports, that those who missed the 1A0KM operation because of the Dayton Hamvention in late April might have another chance to work them. The next operation will take place during the Christmas holidays in December of 1991. The April operation had a total of over 18000 contacts which included some contacts on the WARC bands. One of the difficulties they had in operating during the evening hours was that the RF sets off the security alarm, but they have been experimenting with antenna placement to avoid the problem.

C2, NAURU. There has been plenty of CW contacts given out by C21NI this past week. C21NI seems to be active mainly on 40 and 20 meters. Check around 7005 or 7015 KHz between 1000 to 1130Z and around 14013 +/- 3 KHz also between 1000 to 1130Z. QSL via K0HGW.

D2, ANGOLA. The group operating from D2-land is making alot of CW ops, as well as SSB ops happy. They are operating all bands and have been active on the WARC bands. Check 3508, 7001/7005, 14025/14195/14275, 18115/18120, 21025/21235/21275, 24940 and 28001/28026 KHz. Operations may be over by the time you read this, because earlier announcements stated the UB5 group had to be back by June 11. QSL D2ACA via LZ2DF. Some of the operators are also signing D2/UT4UM AND D2/RT5UY. QSL to their CallBook address. UPDATE 6/9: They have announced the operation will end June 26.

FB8WZ, CROZET ISLAND? Several times this past week, a station signing FB8WZ has been operating RTTY and AMTOR/FEC and claims to be on Crozet Island. FB8WZ has been heard between 14088 to 14091 KHz around 0645 to 0830Z and again around 1155Z. He says QSL via Bureau of Communications, Box 3, Crozet Island. It is unlikely this station is legit, but remember WORK FIRST WORRY LATER (WFWL)! FT4WC, who is for sure on Crozet, continues to be active on CW between 14021 and 14027 around 1200 to 1300Z.

K5VT, VINCE THOMPSON. Tim, KQ8M, in a RTTY coversation with Vince, reports the following: Vince was supposed to return to S2 (Bangladesh) in February, but due to the governmental changes in the country he did not go. He is still hoping to go back when things settle down and possibly even take RTTY gear to operate from S2! Also, Vince mentioned he has been to XZ (Myanmar) 8 to 9 times in the past 10 years. He has received oral permission to operate amateur radio from XZ, but the officials will not give him the proper written documentation to operate "legally". Vince is going to continue to pursue "legal" permission, to operate from XZ as well as S2. (KYFC!!) EXTRA NOTE: QSL Cards for Vince's S21VT operation are now being received.

OD, LEBANON. Walid, OD5ZZ, has been active this weekend on 15 meters. Check 21333 KHz around 1800Z. QSL to Walid Karami, P.O. Box 782, Tripoli, Lebanon.

OJ0, MARKET REEF. A group from Finland is signing OH2AP/OJ0 from Market Reef. They plan to operate 160 thru 10 meters on CW, SSB and RTTY. There is a possibility of OSCAR 13, 2 and 6 meters activity. Operations will last until June 15. QSL vis OH2AP.

QSL CORRECTION. In the OPDX Bulletin No. 10 we reported a possible new QSL route for TI9US and TI9CF as W3HNK. It has now been found that the QSL route for TI9US is still TI2US. (Sorry!) The QSL route for TI9CF is definitely W3HNK.

QSL CARDS IN THE MAIL. This has been a great week for cards in the mail. The following have been received: 7O1AA (from DL2BCH), 7X5ST/3V, 8Q7DX, C21NI, C9EC, CT3BH, CY9CF, PJ0B, T22KY, T31KY, ZK3KY ZS9Z/1 and ZS9/W6KG.

RUMOR. K8KAE reported hearing on the W2MIG Net that DL7FT/ZA has been worked on 14285 and 14195 KHz this week. No other info is available.

SV5, DODECANESE. SV0HV will arrive on the island sometime between June 10th to 13th for about a one week operation. Callsign will be SV0HV/SV5. QSL to KA5EJX (only 90 or 91 CallBook address).

TR, GABON. Norbert, F6AXX, is now signing TR8/F6AXX. He is very active on CW 15 to 20 KHz from the bottom end of 10 and 15 meters. Check between 1400 to 1600Z for him.

XQ, SAN FELIX. John, XQ0X, showed up this week on the E.T. Net, June 4, on 14160 KHz around 0130Z. John was supposed to leave the island back in May.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

As for the GRE-0725, a check of the current IC master does NOT reveal this part number. Could you double check that with reality (i.e., what's in the radio) and see if that's for real, and then also check for a manufacturers logo? This would be *very* helpful.

If the CPU is a custom job, it will very likely NOT appear inthe book....the manufacturer will probably tell you that its made under a license that doesn't allow them to tell you anything - and you know how far you'll get with Radio Shaft. The scanner thing is already a sore spot with them....

As I tried to tell the person who posted about this previously, I have the same problem with my BC100XLT and in my opinion it all has to do with battery memory. If you do not fully discharge your battery each time before you charge it, you will gradually lower the capacity for charging your battery. After a while, which was only about 2 months for me, the battery indicator would begin flashing after only about an hour after operation. And I am sure that the battery still had an almost full charge. It is just that somehow because of this memory buildup, the scanner has no access to the previous charge. Trust me, always fully discharge your scanner by leaving it on until it goes dead before you charge it up. This solved my problems.

Regarding statements read here:
>
> I would also say that there are Heathkits, and there
> are Heathkits. Some models are pretty good, and some are, well, not
> so good, design wise. I think the older SB series stuff is fairly
> solid, if not outstanding. I'm a little leery of the HW series stuff.
> It was the 'budget' version of the SB stuff, and had some corners cut.
> Its probably worth the extra 50 bucks to buy the SB-101 instead of the
> HW-101, (or whatever.)
>
Except for the LMO the SB-101 and the HW-101 are electrically
equivalent. They both use the same PC boards, although the
HW-101 doesn't use all the parts that the SB-101 uses (things
like sidetone level adjust, etc.)

The first revisions of the SB-104 (solid state unit) did have
lots of problems, but later revisions did work rather well.
The HW-104 was a spin-off of this later revision. Even the
matching power supply had an oscillation problem under load
(would radiate a weak signal at ~100 MHz).
>
> Some of the early synthesized FM gear was, er, difficult to keep
> going (my brother had one, a mobile rig with thumbwheel switches on
> the front, with all kinds of intermittent PLL lock-up problems)
>
The early version of the HW-2036 did have a limited lock-in
range, but a later revision of it opened this up so that most
units covered ~143 to ~149 MHz. This helped with intermittant
lock-in problems (They still had that annoying whine).

My impression was that the designers were good about proving out
units, based on a sample of one, but not quite aware of variations
in performance caused by typical variations in component values.
It took one or two revisions of a particular model to correct
avoidable problems.

From the RCMA Journal, April 1989:

LOW BATTERY INDICATOR IN THE UNIDEN/BEARCAT 200XLT SCANNER

by Bob Parnass, AJ9S

Some Bearcat 200XLT scanner owners don't get the battery life they expect. They report having to recharge the slide on NiCd (Nickel Cadmium) battery pack after as few as only 3-1/2 hours of operation.

Last month, I discussed the results of several tests made on the 200XLT portable scanner to determine its current consumption. This month, I propose cures for the overly conservative low battery indicator problem.

As presented earlier, the 200XLT low battery indicator begins to flash when battery voltage decreases to 7.2 volts or less. This starts a 10 minute timer within the 200XLT. After the low battery indicator has flashed for 10 minutes, the 200XLT display blanks.

The low battery indicator in three 200XLTs examined is too conservative. Owners have been known to get up to 2 hours more use from the NiCd battery pack after the low battery indicator begins to flash.

The 200XLT Service Information Manual specifies the low battery threshold should be 6.9 volts nominal, with an acceptable range of between 6.5 and 7.2 volts. However, the 7.2 volt threshold measured in 200XLTs is almost out of range.

Zener diode D203, type HZK3CLL01TR, a surface mount component located on the Micom (microcomputer) circuit board, determines the low battery detection threshold.

I have not attempted to alter the 200XLT low battery circuit, but it looks like there are a few ways for an adept technician to fix it:

1. The threshold could be reduced if D203 were to be replaced with a zener diode of lower voltage.
2. The low battery circuit could be bypassed completely

using one of two methods:

a. by removing D203, and connecting the input of
regulator IC204 to the output of IC208, a 5 volt
regulator, or
b. by removing R208, and replacing D203 by a jumper
wire.

The only drawback I could see is that defeating the low
battery circuit might cause memory loss when the bat-
tery voltage becomes too low, because the microcomputer
doesn't detect the low voltage soon enough.

Again, the previous suggestions are conjecture, as I have
not tried either modification. Readers are cautioned:
experimenting with the 200XLT circuitry is risky. The sur-
face mount parts are tiny and the land patterns on the cir-
cuit boards are fragile.

Anyone have any information on the Lambda Amateur Radio Club? I've been trying to contact them for about one month now. No one returns my calls, and I've received no information via mail. Possibly they dissolved or are temporarily inactive. Please contact me if you can provide any information.

277. POTENTIAL MAJOR TO SEVERE GEOMAGNETIC STORM WARNING

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-11 18:08:18 UTC
From: oler@HG.ULeth.CA
Message-ID: <910611120818.27200bab@HG.ULeth.CA>
Source record: 296057

/\

POTENTIAL SEVERE GEOMAGNETIC STORM WARNING

18:00 UT, 11 JUNE

/\

WARNINGS ISSUED OR IN PROGRESS:

- POTENTIAL MAJOR TO SEVERE GEOMAGNETIC STORM WARNING
- POTENTIAL MAJOR SOLAR FLARE WARNING (PROTON)
- SATELLITE PROTON AND PCA ACTIVITY ALERT
- POTENTIAL MAJOR GIC ANOMALY WARNING

ATTENTION:

The major class x12+/3B tenflare which occurred on 11 June is expected to have a major to severe terrestrial impact. Already, significant protons have arrived. The greater than 10 MeV proton levels gradually increased to a peak of 4,400 pfu at 14:25 UT on 11 June. The greater than 100 MeV protons increased to a peak of 66 pfu at 12:45 UT on 11 June. Protons at these energy levels have been decaying since that time. Another increase in protons should accompany the flare shock. A significant increase in greater than 1 MeV protons should also be witnessed concurrent with the shock arrival.

At the present time, geomagnetic activity has subsided. The last disturbance appears to be waning. Significant increases in activity should therefore accompany the approaching flare shock.

The shock from this major event is in transit at the present time and is expected to arrive here at the Earth anytime near or after 06:00 UT on 12 June. Conditions thereafter will deteriorate very rapidly.

Geomagnetic activity is expected to reach at least major storm levels with a very real possibility for severe storming (A-indices > 100). Very intense geomagnetic activity should occur later in the UT day on 12 June and throughout most of the UT day on 13 June. Conditions should begin to recover on 14 June, although recovery will be long and slow.

Significant HF degradation is expected. There is a risk for widespread HF blackouts when the main phase of this storm begins. Severe levels of fading, distortion and absorption can be expected to accompany this storm event. Conditions should begin to improve on 14 June, although a full recovery will take quite a few additional quiet days. The ionosphere will be very stressed during this period and will not be in good shape for communications.

A very high probabiliby (> 80%) exists for widespread VHF backscatter communications later in the UT day of 12 June and on 13 June. Conditions should be very favorable for backscatter from the low and middle latitudes on these dates. High latitudes will also have significant opportunities for VHF backscatter, although the geometry required for backscatter will become increasingly unfavorable as geomagnetic activity approaches or surpasses severe storm levels.

Extensive and widespread low-latitude auroral activity should become visible late in the UT day of 12 June and throughout most of the UT day of 13 June. If the impact from this flare event is as large as predicted, auroral storming may be observed as far south or perhaps even further south than Florida. Continent-wide sightings may also be possible over Australia and New Zealand.

This is a significant storm warning. There is a risk that this storm event could be the largest since 1989, and may in fact become the largest event so far this solar cycle.

PLEASE SEND ANY REPORTS OF DEGRADED RADIO PROPAGATION CONDITIONS, SIGHTINGS OF AURORAL ACTIVITY, VHF BACKSCATTER COMMUNICATIONS OR OTHER ANOMALIES TO: OLER@HG.ULETH.CA (INTERNET), OLER@ALPHA.ULETH.CA (USENET), OR (SNAIL-MAIL) TO: SOLAR TERRESTRIAL DISPATCH, P.O. BOX 357, STIRLING, ALBERTA, CANADA, T0K 2E0. PLEASE INCLUDE THE DATE AND TIME (LOCAL AND UT) OF THE OBSERVATION, THE APPROXIMATE LATITUDE/LONGITUDE OF THE OBSERVATION LOCATION, AND A BRIEF DESCRIPTION OF THE PHENOMENA OBSERVED. WE THANK ALL THOSE WHO TAKE THE TIME TO SEND IN OBSERVATIONAL REPORTS.

/\

278. POTENTIAL SIGNIFICANT LOW LATITUDE AURORAL ACTIVITY WARNING

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-11 18:20:13 UTC
From: oler@HG.ULeth.CA
Message-ID: <910611122013.27200d3e@HG.ULeth.CA>
Source record: 296055

/\

LOW LATITUDE AURORAL ACTIVITY WARNING

UPDATED: 17:30 - 11 JUNE, 1991
VALID: 12 - 13 JUNE

/\

ATTENTION:

A major interplanetary shockwave is in transit at the present time and should arrive here at the Earth anytime near or after 06:00 UT on 12 June. The major class X12+/3B flare which produced this shock was in a very sensitive and well-placed position for producing high to very high terrestrial impacts. The energy released from the flare was also easily sufficient to produce very high terrestrial impacts.

A major to severe geomagnetic storm is expected to begin with the arrival of this shockwave. The accompanying auroral storm is also expected to be rated as major to severe.

Widespread and very active low latitude auroral activity is expected to occur with this event. There is a chance that auroral activity could become visible as far (or further) south as Florida, central Texas, New Mexico and California. Australia and New Zealand are also expected to be treated to an impressive "light show."

This event could become the largest event since 1989 and may actually be observed as the largest terrestrial disturbance so far this solar cycle. The most active day of this period should be 13 June. At that time, geomagnetic and auroral storming should be in the main phase.

Some residual activity may be observed on 14 June, although the probability for observing low-latitude auroral activity on 14 June is not particularly high. By that time, conditions should be decaying back toward more quiet levels.

It would be appreciated if observations of auroral activity could be sent to: oler@hg.uleth.ca (particularly the lower latitudes). If any of you have access to the weather reports with AURBO, it would be very much appreciated if the AURBO reports could be extracted (as-is, verbatim) and sent to either oler@hg.uleth.ca or preferably to oler@alpha.uleth.ca. Thanks to all those who take the time to send in reports.

This is a significant auroral storm warning. Serious observers should take the time to plan a trip to a dark-sky location for this event.

** End of Watch **

279. Re: 813 tubes

>hamfest. What's so great about a 572B that it costs something like $90 or
>more, and even used one's seem to be about $50?

Because there were several commercial linears that used 572's or the pin-
equivalent 811. The 813 was purely a "homebrew" tube.

Why do most published
>designs use really EXPENSIVE tubes? I'm thinking of the ARRL Handbook
>amplifier designs in particular.

Probably because the 813's are no longer readily available. Not everyone
is able/willing to search for them at flea markets.

>and a CQ review of ICOM 229H.
>These all sound like very good comparable rigs, any opinions on them ?

The Kenwood runs hot so mounting position is fairly critical for good air flow. This is a chronic Kenwood problem. The Yeasu is good and the Icom is too. An IC28H might be an even better choice. Also don't ignore Alinco. They are good cheap radios.

>Also, to go with whatever 2m mobile I end up getting, I will need an
>antenna.. any recommendations ? is 5/8 better than 1/4 wave ?

A Larsen 5/8 in the middle of the roof is hard to beat!

>Do they make telescoping 'power' 2m antennas that I could replace my current
>am/fm stereo one with ? I have seen such beasties for CBers.
>This would be a great feature, as I don't want to have anything visible
>outside my car which could encourage thieves (already had one car stolen
>in the city..)

Yes. Antenna Specialists lists a concealed antenna in their commercial police line that can be ordered for amateur frequencies. It replaces your entertainment radio's antenna and still works for the entertainment radio too. About $100.

>Also, I've noticed that VOX headsets are not offered as options on
>mobile rigs, although they are available for HTs .. any ideas why not ?

What do you say when someone cuts you off on the freeway? Would you want the whole town to hear it? :-) Actually you can buy the vox box for Icom headsets that has the 8 pin mobile connector on it instead of the double plug for the HT. Works great on your Icom mobile rig.

>(I realize it is illegal to wear headphones while driving, but it
> is legal as long as ONE ear is not covered (at least in MD))

It's illegal to wear headsets period in Georgia and they *will* pull you over and ticket you if they see you wearing one. This makes little sense because cellphone handsets are legal and tie up a hand as well as block one ear. Then again, who ever said politicians were logical.

284. Yaesu allband mod

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-11 22:17:45 UTC
From: <>
Message-ID: <1991Jun11.221745.7486@sequent.com>
Source record: 296060

I am interested in doing the allband mod to my Yaesu FT 757GX II. I found
the following in the mods database:

>YAESU 757GX
>
> Lert,Peter: "Bootleg HF Radios," _IFR_ magazine, Premiere issue,
> 1985, p. 12.
>
>Open the radio and flip an unmarked but quite accessible switch.
>

I have not been able to locate the magazine. I did pop open my radio, top
and bottom, and couldn't find the switch. Does anyone know where it is?
I did find a row of diodes and jumpers that might possibly have something
to do with this. Is the 757GX II different from the 757GX in this respect?

Potential respondants should note that not only was this not posted from my
account, but it was not even posted from my site. This is because my site
is (and has been for several weeks) experiencing some extensive news feed
problems. Please respond to me via e-mail (to the address in the signature)
as I will very likely never see a posted response.

DISCLAIMER: I want to do this mod for entirely legitimate purposes, such
as using frequencies outside the ham bands as a transverter IF. (Just in
case anyone gets flame happy {:^)

285. Re: Low Battery Indicator on Bearcat 200xlt

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-11 23:14:19 UTC
From: washer@sequent.com
Message-ID: <1991Jun11.231419.7982@sequent.com>
Source record: 296053

In response to Paul's statement that this is all caused by battery memory...

I'll state again, that the battery is reading nearly 7.0volts with 600ma load
on it .... sustained!

This does not sound like a battery with a memory problem (if such problems
exist, given recent net postings on the subject).

I did receive the following e-mail From Adam Keith Levin, that contained
a letter he received from 'Jim Summers, KD7F'

AKL>>A comment on the current required to hold the memory contents:
AKL>>
AKL>>The .5 mA measured with the power switch in the off position is not
AKL>>the current required to maintain the RAM contents in the processor.
AKL>>Rather, it is being drawn by a voltage divider used to create a 5.6
AKL>>volt regulator using a 3 terminal 5 volt regulator. A 10K resistor
AKL>>is placed between the regulator output and the ground terminal of the
AKL>>regulator IC. The regulator will force 5 volts across this resistor
AKL>>and therefore .5 ma will flow in it. The ground terminal of the
AKL>>regulator is connected to battery ground through 1.2K. This .5 ma
AKL>>will flow to battery ground through the 1.2K raising the regulator
AKL>>ground terminal .6 volts above battery ground.
AKL>>
AKL>>The reason the designers wanted 5.6 volts from this regulator was to
AKL>>provide 5 volts on the other side of a diode which is used to isolate
AKL>>the regulator from the capacitor which holds the memory contents when
AKL>>the battery pack is removed. The RAM is located in the CMOS processor
AKL>>(IC201) so this 5 volt regulator provides the Vdd for the processor
AKL>>when the scanner is on.
AKL>>
AKL>>I was able to reduce the switch off current drain by a factor of 10
AKL>>by replacing the resistor between the ground terminal of the regulator
AKL>>and battery ground (R243) with a diode, and increasing the value of the
AKL>>10K resistor (R244) to 100K.
AKL>>
AKL>>Low battery warning:
AKL>>
AKL>>I have also modified the low battery warning circuitry in my scanner
AKL>>so that the warnings start at 6.6 volts (originally 7.2V in my unit.)
AKL>>I had no data on the part (IC-204) that acts as a comparator to detect
AKL>>low battery voltage so I experimented with a resistive voltage divider
AKL>>in place of the zener diode (D203) and 150K resistor (R208). I ended up
AKL>>with a 5.11K in place of the diode and a 10K for R208. This circuit
AKL>>will draw .5 ma or so from a fully charged battery but this is negligable

AKL>>compared to the total current requirements of the scanner. (This current
AKL>>only flows with the power switch on.)
AKL>>
AKL>>While these modifications have increased my satisfaction with my
AKL>>BC205XLT, I would not recommend them to people who have not had some
AKL>>experience working with surface mount components. Static discharge
AKL>>precautions should also be taken. Proceed at your own risk!
AKL>>
AKL>>
AKL>>

His second point, about the indicator coming on at 7.2 volts, is probably the culprit. I'll have a shot at his mod, or something similar, and post the results.

jim KG7HH 1-503-578-3171

(virtually the same radio). I have the 100 and am thinking about buying a 120 for my YL. (incentive to get her license) Mine has the 130 - 170 Mhz recieve on it.

Thanks much,

Mike Gordon N9LOI (please respond via email)

287. Glossary of Solar-terrestrial Terms

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-12 01:39:46 UTC
From: acourt@lunatix.uucp
Message-ID: <1991Jun12.013946.2031@lunatix.uucp>
Source record: 295993
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

I found this list of terms used in solar-terrestrial reports in an astronomy echo somewhere a couple of years ago. I thought it would be a good idea to post this since some folks have had questions about what Mr. Oler's reports to the net mean.

Hope this is helpful.

GLOSSARY OF SOLAR-TERRESTRIAL TERMS

a INDEX. A 3-hourly "equivalent amplitude" index of local geomagnetic activity; "a" is related to the 3-hourly K INDEX according to the following scale:

K 0 1 2 3 4 5 6 7 8 9
a 0 3 7 15 27 48 80 140 240 400

A INDEX. A daily index of geomagnetic activity derived as the average of the eight 3-hourly a indices.

ACTIVE. Geomagnetic levels such that 15 <= Ap < 30.

ACTIVE DARK FILAMENT (ADF). An ACTIVE PROMINENCE seen on the DISK.

ACTIVE LONGITUDE. The approximate center of a range of heliographic longitudes in which ACTIVE REGIONS are more numerous and more FLARE-active than the average.

ACTIVE PROMINENCE. A PROMINENCE displaying material motion and changes in appearance over a few minutes of time.

ACTIVE PROMINENCE REGION (APR). A portion of the solar LIMB displaying ACTIVE PROMINENCEs.

ACTIVE REGION (AR). A localized, transient volume of the solar atmosphere in which PLAGEs, SUNSPOTS, FACULAe, FLAREs, etc. may be observed.

ACTIVE SURGE REGION (ASR). An ACTIVE REGION that exhibits a group or series of spike-like surges that rise above the limb.

AFRED. Abbreviation for the A INDEX for Fredericksburg.

ANGSTROM. A unit of length = 1.0E-08cm.

Ap INDEX. An averaged planetary A INDEX based on data from a set of specific stations.

ARCH FILAMENT SYSTEM (AFS). A bright, compact PLAGE crossed by a system of small, arched FILAMENTS, which is often a sign of rapid or contin-

ued growth in an ACTIVE REGION.

ASTRONOMICAL UNIT (AU). The mean earth-sun distance, equal to 1.496E+13cm or 214.94 solar radii.

AURORA. A faint visual phenomenon associated with geomagnetic activity, which occurs mainly in the high-latitude night sky; typical auroras are 100 to 250 km above the ground.

AURORAL OVAL. An oval band around each geomagnetic pole which is the locus of structured AURORAe.

AUTUMNAL EQUINOX. The EQUINOX that occurs in September.

BARTEL'S ROTATION NUMBER. The serial number assigned to 27-day rotation periods of solar and geophysical parameters. Rotation 1 in this sequence was assigned arbitrarily by Bartel to begin in January 1833.

BRIGHT SURGE ON THE DISK (BSD). A bright gaseous stream (SURGE) emanating from the CHROMOSPHERE.

BRIGHT SURGE ON THE LIMB (BSL). A large gaseous stream (SURGE) that moves outward more than 0.15 solar radius above the LIMB.

BURST. A transient enhancement of the solar RADIO EMISSION, usually associated with an ACTIVE REGION or FLARE.

CARRINGTON LONGITUDE. A system of fixed longitudes rotating with the sun.

CENTIMETER BURST. A solar radio burst in the centimeter wavelength range.

CENTRAL MERIDIAN PASSAGE (CMP). The passage of an ACTIVE REGION or other feature across the longitude meridian that passes through the apparent center of the solar DISK.

CHROMOSPHERE. The layer of the solar atmosphere above the PHOTOSPHERE and beneath the TRANSITION REGION and the CORONA.

CONJUGATE POINTS. Two points on the earth's surface, at opposite ends of a geomagnetic field line.

CONTINUUM STORM (CTM). General term for solar noise lasting for hours and sometimes days.

COORDINATED UNIVERSAL TIME. By international agreement, the local time at the prime meridian, which passes through Greenwich, England. Therefore, it is also known as GREENWICH MEAN TIME, or sometimes simply UNIVERSAL TIME.

CORONA. The outermost layer of the solar atmosphere, characterized by low densities (<1.0E+09/cc) and high temperatures (>1,0E+06deg.K).

CORONAL HOLE. An extended region of the CORONA, exceptionally low in density and associated with unipolar photospheric regions.

CORONAL RAIN (CRN). Material condensing in the CORONA and appearing to rain down into the CHROMOSPHERE as observed in H-ALPHA at the solar LIMB above strong SUNSPOTS.

CORONAL TRANSIENTS. A general term for short-time-scale changes in the CORONA, but principally used to describe outward-moving PLASMA clouds.

COSMIC RAY. An extremely energetic (relativistic) charged particle.

CROCHET. A sudden deviation in the sunlit geomagnetic field (H component; see GEOMAGNETIC ELEMENTS) associated with large solar FLARE X-ray emission.

D REGION. A daytime layer of the earth's IONOSPHERE approximately 50 to 90 km in altitude.

DARK SURGE ON DISK (DSD). Dark gaseous ejections visible in H-ALPHA.

DIFFERENTIAL ROTATION. The change in SOLAR ROTATION RATE with latitude. Low latitudes rotate at a faster angular rate (approx. 14 degrees per day) than do high latitudes (approx. 12 degrees per day).

DISAPPEARING SOLAR FILAMENT (DSF). The sudden (timescale of minutes to hours) disappearance of a solar FILAMENT (PROMINENCE).

DISK. The visible surface of the sun (or any heavenly body) projected against the sky.

Dst INDEX. A geomagnetic index describing variations in the equatorial RING CURRENT.

E REGION. A daytime layer of the earth's ionosphere roughly between the altitudes of 85 and 140 km.

EMERGING FLUX REGION (EFR). An area on the sun where new magnetic flux is erupting.

ERUPTIVE PROMINENCE ON LIMB (EPL). A solar PROMINENCE that becomes activated and is seen to ascend from the sun.

EXTREMELY LOW FREQUENCY (ELF). That portion of the radio frequency spectrum from 30 to 3000 hertz.

EXTREME ULTRAVIOLET (EUV). A portion of the electromagnetic spectrum from approximately 100 to 1000 angstroms.

F CORONA. Of the white-light CORONA (that is, the corona seen by the eye at a total solar ECLIPSE), that portion which is caused by sunlight scattered or reflected by solid particles (dust) in interplanetary space.

F REGION. The upper layer of the IONOSPHERE, approximately 120 to 1500 km in altitude. The F region is subdivided into the F1 and F2 regions. The F2 region is the most dense and peaks at altitudes between 200 and 600 km. The F1 region is a smaller peak in

electron density, which forms at lower altitudes in the daytime.

FACULA. A bright region of the PHOTOSPHERE seen in white light, seldom visible except near the solar LIMB.

FIBRIL. A linear pattern in the H-ALPHA CHROMOSPHERE of the sun, as seen through an H-alpha filter, occurring near strong SUNSPOTS and PLAGE or in FILAMENT channels.

FILAMENT. A mass of gas suspended over the PHOTOSPHERE by magnetic fields and seen as dark lines threaded over the solar DISK. A filament on the LIMB of the sun seen in emission against the dark sky is called a PROMINENCE.

FILAMENT CHANNEL. A broad pattern of FIBRILS in the CHROMOSPHERE, marking where a FILAMENT may soon form or where a filament recently disappeared.

FLARE. A sudden eruption of energy on the solar DISK lasting minutes to hours, from which radiation and particles are emitted.

fMIN. The lowest radiowave frequency that can be reflected from the IONOSPHERE.

foEs. The maximum ORDINARY MODE radiowave frequency capable of reflec-tion from the SPORADIC E REGION of the IONOSPHERE.

foF2. The maximum ORDINARY MODE radiowave frequency capable of reflec-tion from the F2 REGION of the IONOSPHERE.

FORBUSH DECREASE. An abrupt decrease, of at least 10%, of the background galactic COSMIC RAY intensity as observed by neutron monitors.

GAMMA. A unit of magnetic field intensity equal to 1 x 10.0E-05 GAUSS, also equal to 1 NANOTESLA.

GAMMA RAYS. High energy radiation (energies in excess of 100 keV) observed during large, extremely energetic solar FLARES.

GAUSS. The unit of magnetic induction in the cgs (centimeter-gram-second) system.

GEOMAGNETIC ELEMENTS. The components of the geomagnetic field at the sur-face of the earth. In SESC use, the northward and eastward components are often called the H and D components, where the D component is expressed in gammas and is derived from D (the declination angle) using the small angle approximation.

GEOMAGNETIC FIELD. The magnetic fiebserved in and around the earth. The intensity of the magnetic field at the earth's surface is approximately 0.32 gauss at the equator and 0.62 gauss at the north pole.

GEOMAGNETIC STORM. A worldwide disturbance of the earth's magnetic field, distinct from regular diurnal variations.

Minor Geomagnetic Storm: A storm for which the Ap index was greater than 29 and less than 50.

Major Geomagnetic Storm: A storm for which the Ap index was greater than 49 and less than 100.

Severe Geomagnetic Storm: A storm for which the Ap index was 100 or more.

Initial Phase: Of a geomagnetic storm, that period when there may be an increase of the MIDDLE-LATITUDE horizontal intensity (H).

Main Phase: Of a geomagnetic storm, that period when the horizontal magnetic field at middle latitudes is generally decreasing.

Recovery Phase: Of a geomagnetic storm, that period when the depressed northward field component returns to normal levels.

GEOSYNCHRONOUS. Term applied to any equatorial satellite with an orbital velocity equal to the rotational velocity of the earth. The net effect is that the satellite is virtually motionless with respect to an observer on the ground.

GMT. Greenwich Mean Time. (See COORDINATED UNIVERSAL TIME.)

GRADUAL COMMENCEMENT. The commencement of a geomagnetic storm that has no well-defined onset.

GRANULATION. Cellular structure of the PHOTOSPHERE visible at high spatial resolution.

GREEN LINE. The green line is one of the strongest (and first-recognized) visible coronal lines. It identifies moderate temperature regions of the CORONA.

Greenwich Mean Time. See COORDINATED UNIVERSAL TIME.

GROUND-LEVEL EVENT (GLE). A sharp increase in ground-level COSMIC RAY count to at least 10% above background, associated with solar protons of energies greater than 500 MeV. GLEs are relatively rare, occurring only a few times each SOLAR CYCLE.

H-ALPHA. This ABSORPTION LINE of neutral hydrogen falls in the red part of the visible spectrum and is convenient for solar observations. The H-alpha line is universally used for patrol observations of solar flares.

H-component of the Geomagnetic Field. See GEOMAGNETIC ELEMENTS.

HIGH FREQUENCY (HF). That portion of the radio frequency spectrum between between 3 and 30 MHz.

HIGH LATITUDES. With specific reference to zones of geomagnetic activity, "high latitudes" refers to 50o to 80o geomagnetic.

HIGH-SPEED STREAM. A feature of the SOLAR WIND having velocities that are about double average solar wind values.

HOMOLOGOUS FLARES. Solar flares that occur repetitively in the same ACTIVE REGION, with essentially the same position and with a common pattern of development.

HYDER FLARE. A FILAMENT-associated TWO-RIBBON FLARE, often occurring in spotless regions. The flare presumably results from the impact on the CHROMOSPHERE of infalling FILAMENT material.

INTERPLANETARY MAGNETIC FIELD (IMF). The magnetic field carried with the SOLAR WIND.

IONOSPHERE. The region of the earth's upper atmosphere containing a small percentage of free electrons and ions produced by photoionization of the constituents of the atmosphere by solar ultraviolet radiation at very short wavelengths (<1000 angstroms). The ionosphere significantly influences radiowave propagation of frequencies less than about 30 MHz.

IONOSPHERIC STORM. A disturbance in the F REGION of the IONOSPHERE, which occurs in connection with geomagnetic activity.

K CORONA. Of the white-light CORONA (that is, the corona seen by the eye at a total solar eclipse), that portion which is caused by sunlight scattered by electrons in the hot outer atmosphere of the sun.

K INDEX. A 3-hourly quasi-logarithmic local index of geomagnetic activity relative to an assumed quiet-day curve for the recording site. Range is from 0 to 9. The K index measures the deviation of the most disturbed horizontal component.

KELVIN. A unit of absolute temperature.

Kp INDEX. A 3-hourly planetary geomagnetic index of activity generated in Gottingen, Germany, based on the K INDEX from 12 or 13 stations distributed around the world.

LEADER SPOT. In a magnetically bipolar or multipolar SUNSPOT group, the western part precedes and the main spot in that part is called the leader.

LIGHT BRIDGE. Observed in white light, a bright tongue or streaks penetrating or crossing SUNSPOT UMBRAe. The appearance of a light bridge is frequently a sign of impending region division or dissolution.

LIMB. The edge of the solar DISK.

LIMB FLARE. A solar FLARE seen at the edge (LIMB) of the sun.

LOOP PROMINENCE SYSTEM (LPS). A system of loop prominences associated with major FLARES.

LOW FREQUENCY (LF). That portion of the radio frequency spectrum from 30 to 300 kHz.

M 3000. The optimum HIGH FREQUENCY radio wave with a 3000 km range, which reflects only once from the IONOSPHERE (single hop transmission).

MAGNETIC BAY. A relatively smooth excursion of the H (horizontal) component (see GEOMAGNETIC ELEMENTS) of the geomagnetic field away from and returning to quiet levels.

MAGNETOGRAM. Solar magnetograms are a graphic representation of solar magnetic field strengths and polarity.

MAGNETOPAUSE. The boundary layer between the SOLAR WIND and the MAGNETOSPHERE.

MAGNETOSPHERE. The magnetic cavity surrounding the earth, carved out of the passing SOLAR WIND by virtue of the GEOMAGNETIC FIELD, which prevents, or at least impedes, the direct entry of the solar wind PLASMA into the cavity.

MeV. Mega (million) electronvolt. A unit of energy used to describe the total energy carried by a particle or photon.

MEDIUM FREQUENCY (MF). That portion of the radio frequency spectrum from 0.3 to 3 MHz.

MICROWAVE BURST. A radiowave signal associated with optical and/or X-ray FLAREs.

MIDDLE LATITUDES. With specific reference to zones of geomagnetic activity, "middle latitudes" refers to 20 deg. to 50 deg. geomagnetic.

MOUNT WILSON MAGNETIC CLASSIFICATIONS.

Alpha. Denotes a unipolar SUNSPOT group.

Beta. A sunspot group having both positive and negative magnetic polarities, with a simple and distinct division between the polarities.

Beta-Gamma. A sunspot group that is bipolar but in which no continuous line can be drawn separating spots of opposite polarities.

Delta. A complex magnetic configuration of a solar sunspot group consisting of opposite polarity UMBRAe within the same PENUMBRA.

Gamma. A complex ACTIVE REGION in which the positive and negative polarities are so irregularly distributed as to prevent classification as a bipolar group.

NANOTESLA (nT). A unit of magnetism 10.0E-09 tesla, equivalent to a gamma (10.0E-05 gauss).

NEUTRAL LINE. The line that separates longitudinal magnetic fields of opposite polarity.

PENUMBRA. The SUNSPOT area that may surround the darker UMBRA or umbrae. It consists of linear bright and dark elements radial from the sunspot umbra.

PERSISTENCE. Continuation of existing conditions. When a physical parameter varies slowly, the best prediction is often persistence.

PHOTOSPHERE. The lowest layer of the solar atmosphere; corresponds to the solar surface viewed in WHITE LIGHT. SUNSPOTs and FACULAe are observed in the photosphere.

PLAGE. An extended emission feature of an ACTIVE REGION that exists from the emergence of the first magnetic flux until the widely scattered remnant magnetic fields merge with the background.

PLAGE CORRIDOR. A space in chromospheric (see CHROMOSPHERE) PLAGE lacking plage intensity, coinciding with polarity inversion line.

PLASMA. Any ionized gas, that is, any gas containing ions and electrons.

POLAR CAP ABSORPTION (PCA). An anomalous condition of the polar IONOSPHERE whereby HF and VHF (3 - 300 MHz) radiowaves are absorbed, and LF and VLF (3 - 300 kHz) radiowaves are reflected at lower altitudes than normal. In practice, the absorption is inferred from the proton flux at energies greater than 10 MeV, so that PCAs and PROTON EVENTs are simultaneous. Transpolar radio paths may still be disturbed for days, up to weeks, following the end of a proton event.

POST-FLARE LOOPS. A LOOP PROMINENCE SYSTEM often seen after a major TWO-RIBBON FLARE, which bridges the ribbons.

PROMINENCE. A term identifying cloud-like features in the solar atmosphere. The features appear as bright structures in the CORONA above the solar LIMB and as dark FILAMENTs when seen projected against the solar DISK.

PROTON EVENT. By definition, the measurement of at least 10 protons/sq.cm/sec/steradian at energies greater than 10 MeV.

PROTON FLARE. Any FLARE producing significant FLUXes of greater-than-10 MeV protons in the vicinity of the earth.

QUIESCENT PROMINENCE (FILAMENT). Long, sheet-like prominences nearly vertical to the solar surface.

QUIET. A descriptive word specifically meaning geomagnetic levels such that Ap < 8 (see Ap INDEX).

RADIO EMISSION. Emissions of the sun in radio wavelengths from centimeters to dekameters, under both quiet and disturbed conditions.

Type I. A noise storm composed of many short, narrow-band bursts in the metric range (300 - 50 MHz).

Type II. Narrow-band emission that begins in the meter range (300 MHz) and sweeps slowly (tens of minutes) toward dekameter wavelengths (10 MHz). Type II emissions occur in loose association with major FLAREs and are indicative of a SHOCK wave moving through the solar atmosphere.

Type III. Narrow-band bursts that sweep rapidly (seconds) from decimeter to dekameter wavelengths (500 - 0.5 MHz). They often occur in groups and are an occasional feature of complex solar ACTIVE REGIONs.

Type IV. A smooth continuum of broad-band bursts primarily in the meter range (300 - 30 MHz). These bursts are associated with some major flare events beginning 10 to 20 minutes after the flare maximum, and can last for hours.

RECURRENCE. Used especially in reference to the recurrence of physical parameters every 27 days (the rotation period of the sun).

RIOMETER (Relative Ionospheric Opacity meter). A specially designed radio receiver for continuous monitoring of COSMIC NOISE. The absorption of cosmic noise in the polar regions is very sensitive to the solar low-energy cosmic ray flux.

SECTOR BOUNDARY. In the SOLAR WIND, the area of demarcation between sectors, which are large-scale features distinguished by the predominant direction of the interplanetary magnetic field, toward or away from the sun.

SHORT WAVE FADE (SWF). A particular ionospheric solar flare effect under the broad category of sudden ionospheric disturbances (SIDs) whereby short-wavelength radio transmissions, VLF, through HF, are absorbed for a period of minutes to hours.

SMOOTHED SUNSPOT NUMBER. An average of 13 monthly RI numbers, centered on the month of concern.

SOLAR COORDINATES.

Central Meridian Distance (CMD). The angular distance in solar longitude measured from the central meridian.

SOLAR CYCLE. The approximately 11-year quasi-periodic variation in frequency or number of solar active events.

SOLAR MAXIMUM. The month(s) during the SOLAR CYCLE when the 12-month mean of monthly average SUNSPOT NUMBERS reaches a maximum. The most recent solar maximum occurred in December 1979.

SOLAR MINIMUM. The month(s) during the SOLAR CYCLE when the 12-month mean of monthly average SUNSPOT NUMBERS reaches a minimum.

SOLAR SECTOR BOUNDARY (SSB). The apparent solar origin, or base, of the interplanetary SECTOR BOUNDARY marked by the larger-scale polarity inversion lines.

SOLAR WIND. The outward flux of solar particles and magnetic fields from the sun. Typically, solar wind velocities are near 350 km/s.

SPORADIC E. A phenomenon occurring in the E REGION of the IONOSPHERE, which significantly affects HF radiowave propagation. Sporadic E can occur during daytime or nighttime and it varies markedly with latitude.

SUDDEN COMMENCEMENT(SC, or SSC for Storm Sudden Commencement). An abrupt increase or decrease in the northward component of the geomagnetic field, which marks the beginning of a GEOMAGNETIC STORM.

SUDDEN IMPULSE (SI+ or SI-). A sudden perturbation of several gammas in the northward component of the low-latitude geomagnetic field, not associated with a following GEOMAGNETIC STORM. (An SI becomes an SC if a storm follows.)

SUDDEN IONOSPHERIC DISTURBANCE (SID). HF propagation anomalies due to ionospheric changes resulting from solar FLAREs, PROTON EVENTs and GEOMAGNETIC STORMs.

SUNSPOT. An area seen as a dark spot on the PHOTOSPHERE of the sun. Sunspots are concentrations of magnetic flux, typically occurring in bipolar clusters or groups. They appear dark because they are cooler than the surrounding photosphere.

SUNSPOT GROUP CLASSIFICATION (Modified Zurich Sunspot Classification).

A - A small single unipolar SUNSPOT or very small group of spots without PENUMBRA.

B - Bipolar sunspot group with no penumbra.

C - An elongated bipolar sunspot group. One sunspot must have penumbra.

D - An elongated bipolar sunspot group with penumbra on both ends of the group.

E - An elongated bipolar sunspot group with penumbra on both ends. Longitudinal extent of penumbra exceeds 10 deg. but not 15 deg.

F - An elongated bipolar sunspot group with penumbra on both ends. Longitudinal extent of penumbra exceeds 15 deg.

H - A unipolar sunspot group with penumbra.

SUNSPOT NUMBER. A daily index of SUNSPOT activity (R), defined as R = k (10 g + s) where S = number of individual spots, g = number of sunspot groups, and k is an observatory factor.

SURGE. A jet of material from ACTIVE REGIONs that reaches coronal heights and then either fades or returns into the CHROMOSPHERE along the trajectory of ascent.

TWO-RIBBON FLARE. A FLARE that has developed as a pair of bright strands (ribbons) on both sides of the main inversion ("neutral") line of the magnetic field of the ACTIVE REGION.

TYPE I, II, III, IV. See RADIO EMISSION

U BURST. A fast radio burst spectrum of a FLARE. It has a U-shaped appearance in an intensity-vs.-frequency plot.

ULTRA HIGH FREQUENCY (UHF). Those radio frequencies exceeding 300 MHz.

UMBRA. The dark core or cores (umbrae) in a SUNSPOT with PENUMBRA, or a sunspot lacking penumbra.

UNIVERSAL TIME (UT). See COORDINATED UNIVERSAL TIME.

UNSETTLED. With regard to geomagnetic levels, a descriptive word specifically meaning that 7 < the Ap INDEX < 15.

VERY HIGH FREQUENCY (VHF). That portion of the radio frequency spectrum from 30 to 300 MHz.

VERY LOW FREQUENCY (VLF). That portion of the radio frequency spectrum from 3 to 30 kHz.

WHITE LIGHT (WL). Sunlight integrated over the visible portion of the spectrum (4000 - 7000 angstroms) so that all colors are blended to appear white to the eye.

WHITE LIGHT FLARE. A major FLARE in which small parts become visible in white light. Such flares are usually strong X-ray, radio, and particle emitters.

WOLF NUMBER. An historic term for SUNSPOT NUMBER. In 1849, R. Wolf of Zurich originated the general procedure for computing the sunspot number.

X-RAY BACKGROUND. A daily average background X-ray FLUX in the 1 to 8 angstrom range. It is a midday minimum designed to reduce the effects of FLAREs.

X-RAY BURST. A temporary enhancement of the X-ray emission of the sun. The time-intensity profile of soft X-ray bursts is similar to that of the H-ALPHA profile of an associated FLARE.

X-RAY FLARE CLASS. Rank of a FLARE based on its X-ray energy output. Flares are classified by the order of magnitude of the peak burst intensity (I) measured at the earth in the 1 to 8 angstrom band as follows:

Class (in Watt/sq. Meter)

B I < 10.0E-06

C 10.0E-06 <= I <= 10.0E-05

M 10.0E-05 <= I <= 10.0E-04

X I >= 10.0E-04

ZURICH SUNSPOT CLASSIFICATION. A sunspot classification system that has been modified for SESC use.

Remember, the Pro-2005 is made by a company called General Radio
Electronics, or GRE. I would take an educated guess that it's
a custom chip.

290. MAJOR SOLAR FLARE ALERT - 11 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-12 06:31:04 UTC
From: oler@HG.ULeth.CA
Message-ID: <910612003104.27200c43@HG.ULeth.CA>
Source record: 296068

-- MAJOR SOLAR FLARE ALERT --

JUNE 11, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

Another flare from Region 6659 just barely managed to become a major category flare today. The event was a very long duration event. It began at 20:03 UT, peaked at 21:32 UT and ended at 23:07 UT on 12 June. It was rated a class M5.3/1B event and was associated with a moderate intensity Type IV sweep which has now been classified as a continuum. Radio bursts were not particularly large with this event. The flare was located at N25W40. X-ray levels never fell back below the class M1 level until after 01:28 UT on 12 June.

A moderate intensity SWF accompanied this flare. The SWF lasted for over two hours at moderate intensity levels and affected most HF frequencies. Conditions began to improve by 22:30 UT.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

There is a small possibility that this flare could produce a low to moderate terrestrial impact. An increase in geomagnetic activity is possible from this event, although significant storming will not be observed. If any impacts do materialize, they probably will not be observed until 14 June and may be masked by the activity expected from yesterdays large X12+/3B event.

Region 6659 continues to pose a significant threat. Major flaring is expected to continue from this complex region. Another major proton flare may become possible over the next 48 hours.

The shock from yesterdays major flare is expected to arrive between 06:00 UT and 15:00 UT, or possibly shortly thereafter. Major to severe geomagnetic and auroral storming is still anticipated.

Warnings and alerts currently in progress include:

- Satellite Proton Alert (~ 500pfu @ >10MeV, ~ 7pfu @ >100 Mev, decaying)
- Polar Cap Absorption Alert (~ 4 dB and decaying)
- Potential Major Flare Warning (proton)
- Potential Major to Severe Geomagnetic Storm Warning (A-Index > 100)
- Potential Low Latitude Auroral Activity Warning

** End of Alert **

291. Looking for a Mods file

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-12 06:32:14 UTC
From: snyderr@wookumz.gnu.ai.mit.edu
Message-ID: <16457@life.ai.mit.edu>
Source record: 296070

I was wondering if anyone could mail me a copy of the mods file that details how to modify an Icom 2GAT to transmit out-of-band. I had it at my packet station, but it was formatted for 80 columns and all I have for packet is a Commodore 64 with 40 columns. Or if someone could point out someplace that I could FTP the mod from, that would be good too. (I have, however, looked around on the Internet a bit, and haven't found this particular mod).
Thanks!

Source record: 296072

I've got one of these beasts which I would like to fix up (dead cold resistor...). I have been unable to find a manual for it and with Eaton in the deep freeze it doesn't look promising for getting one in the future! Does anyone have a manual that I could arrange to make a copy of?

Also, concerning the unit, is it possible to replace the GR900 connectors with APC7's? Can the cold resistor be replaced without wrecking the dewar, and if so does anyone remember how? I presume getting a good match with the hot resistor meant this was originally a factory job, but can it be done by a mere mortal willing to build some test jigs?

Hoping against the odds...

I recieved a Tandy Model 100 today and want to use it as a morse code tutor.
Surely someone, or someone you know, has writen one for this machine. Esp, one
is asm(for better timing). Also how is memory expanded? Where is the archive?
Where would I subscribe to a mailing list?
Thanks in advance for any pointers sent my way.

I have to mournfully announce that I am now two radios less rich. I lost my brand new ICOM 2GAT last Monday and this Monday I lost my 2-year-old ICOM 32AT. :-(.....

Now for the good news: My daughter Penny, aged 13, KA1VUA, upgraded to Tech Plus on last Monday. My son Alex, aged 14, KA1VWX, upgraded to Tech Plus this Monday. They asked me to report that they both are enjoying their new radios very much.

Now, if my ICOM W2A would just hurry up and come in!!!!

CHEERS!

The low battery indicator problem on the 200xlt has been
the topic of discussion in several articles in Montoring Times.
A modification for the 200xlt has been printed several times
in that magazine and its results have received rave review
from the readership.

I assumed that someone on the the net would have posted the
fix by now, but I have yet to see it. I will attempt to
sift through several years of magazines and see if I can locate
the articles in question. Please stand by.....

297. Re: 813 tubes

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-12 13:40:30 UTC
From: jayk@hpfcso.FC.HP.COM
Message-ID: <103360023@hpfcso.FC.HP.COM>
Source record: 296000

The 813 is only rated for full specs up to 30 MHz. As I remember (digging way back) they aren't a great tube for 10 meters. For somewhat lower frequencies they are fine.

73, Jay K0GU

298. More Info on Ramsey 2 M transceiver

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-12 13:54:23 UTC
From: gibbonsj@iccgcc.decnet.ab.com
Message-ID: <1991Jun12.085423.4839@iccgcc.decnet.ab.com>
Source record: 296071

With some of the responses I've been getting concerning the posting of the Ramsey 2M kit, I think I should clairify a few points.

Being that this is a fairly involved kit, you may want to consider holding off on buying one if you have never built a kit before (unless you have access to an 'ELMER' for assistance) or are uncomfortable with building/tinkering/troubleshooting electronics gear. If you are expecting to populate the board and expect it to work perfectly without assistance, you may be disappointed (then again, you might get lucky!). The kit represents a great base radio from which to start from, but may be a little intimidating (sp?) to those who don't like to tinker or expect not to have to twiddle with it.

I finished my kit (minus populating the final driver stage for calibration reasons) Monday night and it seems to be working fine. I did, however, have to 'tweek' a few cap values (changed 56pF caps to 68pF) in 3 of the 4 Colpits oscillators to get the adjustment range to work correctly for the calibration. I'm still going to play around with the receiver front-end since I think the sensitivity is not optimal yet.

Other notes - you will need the following to build this kit:

Soldering iron, solder (rosin-core), normal hand tools, DVM, frequency counter (capable of measuring up to 148.0000 MHZ with at least a 100 HZ resolution), a RF power meter and a 3/8" x 18 bolt (to wind the 3 output inductors on - you can also use the handle of an x-acto knife). You will also need some RF adjustment tools (twiddle sticks) to adjust the inductors/capacitors for the final alignment.

My kit basically worked first try, but needed to be tweeked to really operate as specified (I still haven't populated the final stage yet, so I don't know what kind of power this thing puts out yet - but that is just 2 transistors and 6 solder joints away...).

The only other comment about the alignment is that the procedure to align the receiver is somewhat misleading. You adjust the 3 tunable inductors for maximum noise with no signal, then adjust for maximum gain with a weak signal. Using this technique ended up (at least for me) with a badly mis-tuned receiver. Once I threw away the manual and used some common sense, the receiver came up and worked just fine.

So that makes 3 of the 4 kits our group of friends purchased are now working. (Come on KA9EKE, get the lead [/tin] out [and start soldering]!)

Definately a FUN kit to play with...

>
>Should be good for over 4 Mbps, and if you work it right
>you can put your ID out as a visual signal.

We use this technology to back up our Quantel still store systems.
I decided to run some simple tests. We normally do digital dumps
to one inch professional tape machines with signal to noise ratios
of around 50 db. The encoding technique is fairly tolerant of small
"dropouts" due to tape wear, but longer dropouts due to tape damage
confuse the system. This would correspond to short and long noise
bursts respectively on a radio channel. I dubbed the signal back
and forth between one inch and VHS tape multiple times. This degraded
signal to noise and added the equivalent of some multipath distortion
due to the "smearing" of VHS technology. I got a lot of read errors
on the resulting tape. This isn't real over the air testing, but it
looks like the system would work on P5 transmissions if multipath
is minimized.

The protocol used takes advantage of redundancy and FEC, but the
modulation method, encoding as white and black pixels in an AM
TV field, leaves something to be desired. A direct PSK encoding
would be much better. Also the protocol is designed for half-duplex
with large block sizes, again not ideal for two way packet style
transmissions.

For service on my Drake TR7 I'm looking for

- a TR7 service manual and repair kit (esp. board extenders and jumpers)

- the current address of R.L. Drake Company and their customer service phone number (pref. FAX) to contact for replacement parts if necessary.

Replies requested via internet. Thank you, Andreas.

My family would like to get me a long needed desk mic to work with my ts-430. I have been reccomended the mc-80 kenwood mic and gotten prices anywhere from $72 to $82 without tax/shipping.

Does anyone have any alternative suggestions ??? Our netnews feed has been somewhat "borken" lately so e-mail answers are preferred. I can summarize for the netnews once we have stabilized.

304. Question re: ICOM 7000 spectral display

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-12 16:04:36 UTC
From: wejones@crdec7.apgea.army.mil
Message-ID: <9106121204.aa08583@crdec7.apgea.army.mil>
Source record: 296073

I have been looking for an affordable spectrum analyzer, and was looking in an old EEB catalog at their ICOM 7000 accessories (I have a 7000). They offer a CRIS system with a spectral display option that uses the agc line for signal intensities, and presumably uses the CRIS capabilities to scan through the frequencies. This combination of accessories runs more than $1100 total! Why? If one has the the level converter for the 7000 (which is requires for the above anyway), couldn't one run the agc line to an oscilloscope, and scan through the frequencies of interest via home-made software (or modifications of software available by ftp). There are a variety of ways one could generate the sync pulse. Or for less than $300 one could buy an a-d card for the PC to take the place of the oscilloscope, in addition to providing all sorts of digital and analog inputs & outputs, sooooo, the question is; Why is this thing so expensive? Am I over-simplifing what is involved here? Is there more to the hardware than I am assuming, or are they charging mainly for the software?
Can anyone experienced with controlling the 7000 by computer tell me how fast one can change frequency? If the maximum rate is as slow as the scans generated via the pushbutton controls, it wouldn't make a very useful spectrum analyzer, so I'm hoping it is much faster. Has anyone done what I'm describing here?

I apologize for posting this to the group, but I cannot seem to mail
to Gary directly... even after specifying the entire uucp bang path...

Hello Gary,

First of all, thanks for posting a reply.. now for some more questions :-)

>The Kenwood runs hot so mounting position is fairly critical for good air
>flow. This is a chronic Kenwood problem. The Yeasu is good and the Icom is
>too. An IC28H might be an even better choice. Also don't ignore Alinco. They
>are good cheap radios.

I'm not familiar with the IC28H.. also, I have heard that Kenwood is coming
out with a new TM251A , so I might be able to pick up a 241 at a lower than
usual cost. Ifthis is the case, I'm leaning heavily towards the kenwood,
perhaps I could wire in a smal DC muffin type fan if you say heat is a problem

>Yes. Antenna Specialists lists a concealed antenna in their commercial
>police line that can be ordered for amateur frequencies. It replaces
>your entertainment radio's antenna and still works for the entertainment
>radio too. About $100.

Could you give me the phone number & address of Antenna Specialists so
I can get their catalog ?

>What do you say when someone cuts you off on the freeway? Would you
>want the whole town to hear it? :-) Actually you can buy the vox box
>for Icom headsets that has the 8 pin mobile connector on it instead of
>the double plug for the HT. Works great on your Icom mobile rig.

Understood.. I'll have to use more creative metaphors :-)
What's the part number for the Icom vox box you are referring to
(for the mobile connector) I do not see it in the brochures I have
available to me. This would entail purchasing the HT headset and
then the mobile vox box ?

Also, since there aren't any Ham dealers in the area to my knowledge,
I'll order mail order form someplace.. do you recommend or have experience
with any particular outlet ?

Thanks for your time Gary..

310. Novice study material question

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-12 18:55:36 UTC
From: gss@edsdrd.eds.com
Message-ID: <328@dominion.edsdrd.eds.com>
Source record: 296013

I've recently gotten interested in amateur radio, and have decided to go for my novice class license. I've been too busy this Spring to study both the written material and the code, so since I had an outdated (1988) Radio Shack Novice Voice Class course available, I studied the code first (I assume nothing has changed in Morse Code since 1988). I've finally finished the code tapes and want to start studying for the theory part now. I'd like opinions on which book would be best in my situation.

The RS course is a bit weak, as it just gives the possible questions and answers, without giving much of the theory on which the questions are based. I was ready to go out and get the old standby "Tune in the World with Amateur Radio", when I read a posting here the other day mentioning a replacement book "Now You're Talking", also by ARRL. From what I gather, the new book covers both novice and technician classes; am I right? I'm sure I'll upgrade soon, so would I be better off with "Now You're Talking"? Post or email, at your discretion. I always read my mail, and lately always read this newsgroup (and look forward to the day when I'll understand more of what's discussed here).

Thanks a bunch, good day! (I'll wait until I have my license before I start saying 73's :-)

I called Drake the other day. Repair kits are no longer available.
The extender boards you can make yourself. There is also a "jumper board"
that temporarily replaces the DR-7 digital readout during alignment which
was part of the service kit. This is still available as a separate item
for $17. I see service manuals for sale from time to time in the yellow
sheets for around $25 to $35.

From: denns@sys6626.bison.mb.ca
Message-ID: <9qJg41w164w@sys6626.bison.mb.ca>
Source record: 295984

Hello! This is my first posting on this newsgroup. I am not a HAM yet, though I am 'into' computers and electronics in a big way. The mention of access to that CD-based terrain database is potentially of great interest to the computer people as well e.g. there is a program called VistaPro put out by a company called Virtual Reality, that allows generation of fractal-based terrains (in this case, in 24-bit color). Rendered scenes can be grouped together in animation sequences, etc.. The company also provides data disks of popular 'real' terrains (e.g. Grand Canyon, etc.), for a reasonable fee. It sure would be nice to get access to the source of such data, both as a potential cost-saver and to get at scenes that otherwise would not be published. I do not yet have this software myself, but is next on my 'list'. Anyways, I (and perhaps many other Amiga people, at least) am very interested.

Another potential source of algorithms (which I used myself) is the
December 1987 issue of BYTE magazine, which provides basic PASCAL code
for some popular map projections. It is easy to convert the code to
another language, but of course one has to understand how graphics on
their potential machine works. I had to go elsewhere to find the
algorithm for the 'great circle bearing and distance' projection (if this
has a nice, short name, I don't know it!).

Drop a quarter on the ARRL, they have beginner books and tapes as well as advanced material. The most valuable all around reference in amateur radio is the ARRL Handbook. Every amateur should own a copy. It may seem a little deep for the beginner however. Gordon West also offers an excellent training course. To someone with an electronics background the Novice exam should be mastered in an afternoon. The code will take longer, 2 to 6 weeks depending on your natural talent and dedication. If you like, you can now go directly to the Technician license. The theory exam is much more comprehensive, but there is no code requirement. Study time should be about 3 to 5 days. You can then upgrade to limited HF priviledges by passing a 5 wpm code exam. Perhaps the best method is to skip 5 wpm and learn the code at 13 wpm from the beginning. Then you can go for the General or Advanced exam and have almost all amateur priviledges. If you initially learn the code at 5 wpm you may find you must *relearn* the code for 13 wpm. This is an inefficient and painful experience.

The following was posted to the rec.video.satelite newsgroup and
may be of interest to this newsgroup as well.
--

A new audio service devoted to those with an interest in electronics
will begin later this month on Spacenet 3, Transponder 21, 6.2 audio.
Topics will be mainly Ham Radio and Satellite Technology, but programs
about computers and other techy things are in the works. It will be a 7
day a week service, beginning at 6pm Eastern time and running til
2:00AM. On weekends, the service will begin around 9AM and run til
2:00AM the following morning.

The channel is being put together by the same people who run the QSO HAM
RADIO show on Monday Nights on S1/15.

You can write to them at:

QSO Ham Radio
P.O.B. 254
Syracuse, NY 13215

Tel: 315-673-3752

The channel will be advertiser supported, though they are currently
taking donations. People who have old satellite and ham equipment have
been donating it to the service, and they then auction it off to the
highest bidder. While it is definately "Amateur", not only in its ham
radio content, but also production values, and the audio quality is
quite poor at this time, the programming has quite a bit of promise.
The "Let's Talk Radio" segment will allow YOU to have your own show.
You pick the topic and YOU take the calls.

They also plan to "Uplink" ham radio nets, including the TVRO net. In
addition, they will have ham radio classes, and with the new NO CODE ham
license, this would be a great way for bringing some new techy blood
into the ham radio fraternity. Since LOTS of people blend the technical
hobbies of Ham/Shortwave Radio with Computers AND Satellite, this new
channel promises to be the Technogeeks Haven.

That's S3/21@6.2 audio... STARTING SOME TIME LATER THIS MONTH......

326. 2m/440 quad info wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-13 13:17:13 UTC
From: nucci@climate.gsfc.nasa.gov
Message-ID: <5643@dftsrv.gsfc.nasa.gov>
Source record: 295999

Hello all in net-land....

I got this bug in my head to build something, and being in need of a decent
antenna for 2 meters and 70 cm, I figured why not? I'd like to build a
2 mtr and 70 cm quad antenna, preferably 4 elements, all on the same boom.

I've seen plans for a 2 el 2m quad in QST. I've also combed the antenna book
and the handbook for designs (or at least formulas) to no avail. I don't have
access to miniNEC or any other such computer design program....

So, does anyone out there have plans for a dual band 2m/70cm 4 el quad
or at least point me to the proper source? Any and all help appreciated!

73 and adTHANKSvance!!

Has anyone managed to get this unit to lock on 10224? The units
in question seem to lock fine above this frequency and although
they produce what seems to be adequate power at 10224 they won't lock.
Looking for possible component changes required. Thanks.

I just got two of these radios with a bunch of other things. One
says it doesn't work on it. Both came without battery packs, which
clip on the bottom.
Question: How much Voltage would I put on them to check them?

Anybody know where I could get Battery packs?

What is the power of these? range?

VLF at 42.000 and 42.090 Mhz

Can anyone offer any help?

Thanks
Mack

Paul--Note the original subject line:
MAJOR SOLAR FLARE ALERT - 11 JUNE

I therefore highly suspect the date given in the body of the text
was a simple typo.

However, to answer your question:
WWV announces time hacks as "Coordinated Universal Time" - CUT
UT - Universal Time is a shorthand hack of this
Both versions are anglisations from the international standard phase
(from the French) Universal Time Coordinate' - UTC (so UT is also
shorthand for this!)

UTC is what was previously called Greenwich Mean Time (GMT) (in
terms of being a "standard")

Z is the alpha designator for the time zone where the UTC standard
is kept. Zone A is the next zone going East (hope I didn't flip that)
and so on.

Adding to the confusion, some authorities use numerical time zones.
UTC standard is in zone 12. Subtract one for each zone going West, or
add one per zone going East. In a true fit of mixed zone names, you
will occasionally hear a time zone indication like " Zulu minus six ".

I won't discuss what the U.S. does with EST, PST, etc. or the abberation
of Daylight Savings Time!

Anybody got the correct time?

330. Icom can't ship HF rigs

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-13 14:53:23 UTC
From: derekt@col.hp.com
Message-ID: <54420001@col.hp.com>
Source record: 296011

Earlier this week, I set out to buy an Icom HF rig. While calling around to find the best price, I quickly learned that Icom HF equipment was in short supply. Distributor's were telling me they were out of stock, on back order and unable to give me a expected delivery date because Icom was not shipping any HF equipment. One distributor told me a FET used in all Icom's HF front ends was discontinued and Icom was scrambling to find a replacement. I called Icom America Inc. and the person I talked with confirmed they had a supply problem with "a part" used in all their HF equipment. She said they expected to be shipping this month.

On another note. I know there have been some questions in this note string before about buying mail order. The radio I was looking for was an IC-735. I made 11 phone calls and the difference between the lowest price and the highest price was $80.00. Thats 9% when compared to the lowest price. To my surprise, given the situation I described in the first paragraph, the place with the lowest price had the radio in stock. At least he said he did. I will find out in 3 to 5 days. Only one other place said they had one. Something else. I am not sure I would have found that lower price if not for the short supply situation. I would not have wanted to make that many calls and really did not think the lower price was possible. I would have settled for a price about $30.00 higher.

/ parnass@cbnewse.att.com (Bob Parnass, AJ9S) / 9:33 am Jun 11, 1991 /

*From the RCMA Journal, April 1989:
* LOW BATTERY INDICATOR IN THE UNIDEN/BEARCAT 200XLT SCANNER
*
* I have not attempted to alter the 200XLT low battery cir-
* cuit, but it looks like there are a few ways for an adept
* technician to fix it:
*
* 1. The threshold could be reduced if D203 were to be
* replaced with a zener diode of lower voltage.
* 2. The low battery circuit could be bypassed completely
* using one of two methods:
*
* a. by removing D203, and connecting the input of
* regulator IC204 to the output of IC208, a 5 volt
* regulator, or
* b. by removing R208, and replacing D203 by a jumper
* wire.

I have one of these scanners on order, in the meantime I bought a book:
"Radio / Tech Modifications number 3". For the BC-200XLT they list two
modifications. The first is to remove R-215 to unlock the cellular
phone frequencies. The second is to remove D-203 and R-208 to "extend
battery life". Thats all they say. I haven't seen a schematic, and I'm
not going to blindly try this. You sound somewhat familiar with this
animal, any comments?

From: reichert@motcid.UUCP
Message-ID: <4850@cocoa46.UUCP>
Source record: 296010

Here's a question for everyone to think about. With all the Solar Flares going on, I thought of a recent NOVA program mentioning how the earth's magntic poles do reverse direction. The last time was a million years ago.

The question: What would happen if this happened today? Would the collasping poles produce a electromagnetic wave destructive of all electronics? Would the Pole reversal been deadly to humans by letting in radiation during the reversal? Would it produce a discharge so large as to produce a shock wave destructive to structures?

Or would it produce one hell of an aurora on 2 Meters? I'm hoping for the later! HI

Have fun pondering....Chuck Reichert KD9JQ

I am about to purchase an hf rig for my sailboat, and would appreciate
a reality check from any of you that might be able to provide
guidance.

My intention is to buy:

Yaesu 747GX
remote antenna tuner (Yaesu, Icom, the "generic one?"

I like the light weight and price.

I have a MacGregor 26 which spends most of it's time in the driveway
but when wet is usually on Lake Meade. I also intend to trailer it to
places like Lake Powell, San Diego, Sea of Cortez occasionally
(coastal cruising only - I hope!). I intend to load an insulated
(I'll first try loading uninsulated) backstay. I'm closing in on the 747GX
primarilly because of price. I consider that as a novice sailor,
I may reduce the value of this and other electronic equipment to $0
upon an inadvertant immersion. I can get a 747GX for $699 here in town
at AES.

In addition to regular hf ham stuff, I intend to mod the xmitr for
marine ssb for the "death is imminent" message that I of course hope
never comes. Later, I'd also like to be able to recv wxfax stuf.
Boat has sufficient power (SX30 solar to two lead acid deep cycle
batteries) for my anticipated duty cycle.

So ham/sailors, how 'bout a reality check. Am I missing anything?
Any reasons why I should consider something more elegant (and
expensive)? I've been inactive for awhile. The TS520 at home still
seems new to me. So the visit to the candy store was quite
enlightening. But I appreciate any advice you might be willing to
share.

POLDER@WOLGA is NOT on the info-hams mailing list. He/she/it never has been.

Info-hams HAS got an error-reply address that is separate from the
submission and relay addresses. Has had for months.

What's going on here is that info-hams HAD on it a redistribution list
located at a bitnet site (RPIECS) which accepted a single copy of the
info-hams mailing list from the Internet distribution, re-wrote its
headers to conform to BITNET standards, and remailed it to many dozen
bitnet recipients.

Apparently the mail system at POLDER incorrectly rejected the message
back to the submission address at the bitnet gateway, which being
bidirectional, sent it to the submission address at UCSD, which posted
it to Usenet, and from there back into the digest.

I can't delete an address from the mailing list if it isn't on the
mailing list, and I was unwilling to cut off all the bitnet recipients
of the info-hams digest just because of a single problem.

However, after a week of mailing complaints and requests for assistance
to RPI and getting absolute silence in response, I *DID* cut off the
entire bitnet redistribution list from info-hams. Messages are still
in queues in various places, and I don't think there's really anything
to do but wait them out. Still no word from RPI either.

If I have time, I'll try to insert a filter, but I don't want to break
an otherwise-working gateway for a temporary problem.

Sorry for the hassle, guys, but there's little I can do about it.
- Brian

342. MAJOR GEOMAGNETIC STORM UPDATE - LOW LAT. AURORAL UPDATE - 14 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-13 22:09:34 UTC
From: oler@HG.ULeth.CA
Message-ID: <910613160934.272015cd@HG.ULeth.CA>
Source record: 296016

/\

GEOMAGNETIC STORM UPDATE

/\

22:00 UT, 13 June

STORM UPDATE INFORMATION:

Major to severe geomagnetic storming has been observed over the past 12 to 18 hours (since approximately 07:00 UT on 13 June). Storming intensified after a second sudden magnetic impulse was observed at 06:52 UT on 13 June. Activity since then has ranged from minor to severe storm levels. Magnetopause crossings of several geosynchronous satellites was observed between approximately 18:30 UT and 19:30 UT on 13 June, corresponding to a major to severe geomagnetic activity period. A Forbush decrease of between 10 to 15 percent has been observed with this disturbance.

The A-indices for 13 June are at high-intensity major storm to low-intensity severe storm levels (near 100).

Geomagnetic activity is expected to begin subsiding later in the UT day of 14 June, with a more complete return to generally active levels by 15 June.

Auroral activity over North America on the evening of 12/13 June was disappointingly low. High levels of activity were observed over the northerly middle and high latitude regions, but equatorward expansion and luminosity of the auroral activity was insufficient to provide widespread observations over the lower latitudes. However, this may change on the evening of 13/14 June.

The Low Latitude Auroral Activity Warning remains in effect for the local evening hours of 13/14 June (for North America, between approximately 04:00 UT and 12:00 UT on 14 June). If the present disturbance persists long enough, auroral activity over the lower latitudes may be possible. This is expected to be the last evening for a good chance to view auroral activity over the lower latitudes. The Low Latitude Auroral Activity Warning is expected to be downgraded to a Watch (or possibly even cancelled) for 15 June.

Ionospheric storming has strongly degraded HF radio propagation conditions over the middle to low latitudes. High and polar latitudes are

experiencing blackout conditions due to the ionospheric storming, and PCA activity. Conditions will gradually improve for the low and middle latitudes later in the UT day of 14 June and throughout the entire day of 15 June, while high latitudes will continue to experience fairly strong degraded conditions. A return to more normal ionospheric conditions is not anticipated for the remainder of this week.

344. Tentec (Paragon) Users Group Proposed (20 Meters?)

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-13 23:22:00 UTC
From: nix%muppet.DEcnet@consrt.rok.com
Message-ID: <9106132224.AA08516@ucsd.edu>
Source record: 296005

Several of us (that receive "Info-Hams") are Tentec Paragon transceiver owners, and we've been discussing some of the technical characteristics of the radio.

I'm curious as to whether there might be enough Paragon owners to warrant trying to start a users group, perhaps as a net on 20 meters?

My thought on this is that the group would serve purely as a vehicle to allow the dissemination of information relating to the Paragon (mods, new software, etc.). I have no interest in getting tied into a `formal' operation (ie. I am not an `empire builder').

If there is any existing Tentec (any product) users group/net, then learning about it, and joining, might be the better way, rather than starting a new group.

Opinions ... information as to an existing Tentec group?

*********CAUTION THE FOLLOWING CONTAINS MATERIAL OFFENSIVE TO CB'ERS*********

Fellow amateur radio operators. We have beset upon us a horrible injustice. With open arms and warm smiles we welcomed the lower species into our order. They rewarded us by showering us with the filth they brought with them from whence they came, the 11 meter band.

For years we have suffered at the hands of these; the common, the wretched and the unwashed. We have shuddered as those uninitiated in the radio art asked us, regarding our HF antennae, if we had CB's in our autos and what our code-name was. In fact even at the onset the FCC stole a band that was rightfully ours to give this plague a place to breed and grow in strength untill it was too late.

Now that this unruly, undiciplined, pathetic group has distroyed their (Our!) band they have launched a covert offensive against our remaining bands, beginning with the 2-meter front. Even our protector, the FCC has joined the ranks of this putrid revolution and assisted them in the conquest of more "channels" and legal "lin-yers".

Are we to stand by and watch our society head down the path to its destruction?

Are we expected to teach the unteachable who feel they are doing us a favor by becomming hams?

Should we put up with this impurity any longer

NO! I say the time to rise to the defense of the airwaves is now.

Take a stand for purity in the rf spectum.

God gave rf to those of us who understand it, those who respect it. It is therefore our responsiblity to defend her against this latest influx of foul putrification.

I say UNITE join the Old CW Fart-zies. We can band together and prevent the spread of this dreaded filth.

I know you all understand and want to be part of our movement. Here are some helpful hints to assist you in recognizing the virus.

1. "I'll be on the side"
2. "What do you mean a 600 khz offset, what's that?"
3. "10-4"
4. "Were gone"
5. "Smokey"
6. "Breaker"
7. "What's your handle com-mon?"

8. "What's your 10-20"
9. "I'm destinated"
10. "Wall to wall, you're pegging my needle!" (via repeater)

If you hear any of these witty quotes you are undoubtedly listening to the enemy. Encourage him to take his pathetic drivel elsewhere and leave OUR bands pure.

Others have failed at attempts to purify their society. We must not fail here. Be strong. Be committed. Be an OCF!

**********CB'ers continue reading now**********
Have a nice day, we are your friends.

347. Re: Ramsey 2m Xcvr Kit

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-14 14:28:27 UTC
From: scott@sousa.ltn.dec.com
Message-ID: <1315@sousa.ltn.dec.com>
Source record: 296022

I completed building the kit last weekend and can recommend it. The documentation is great and easy to follow. I had the following problems:

The varactor diodes came precut and bent. The spacing was not the same as the board holes. One diode's leads were too short to go through the wider holes and my trying to push the diode closer to the board broke the diode. I sent the broken diode back to Ramsey and asked for a replacement.

One of the variable caps only turned 1/4 turn which was not quite enough to allow peaking of the power output. So I only get about 3 3/4 watts out. I'll be sending that part back to Ramsey for a replacement.

The receive oscillator required a 1pf capacitor across the varactor to be on frequency. Without the cap it was about 1.2khz off. The +.6 offset osillator required a 10pf cap across its varactor to be on frequency. I expect something similar for the -.6 offset oscillator but thats the one I chose for the broken diode. The 1pf pad still allows reasonable control over 0 and +5khz; with 10pf the adjustment range is restricted so that I'm only able to be within +-600 hz or 0 and +5khz.

I strongly recommend spending the $30 or so for the Ramsey case and knobs. It is metal and very rugged.

I am using it for packet AX25 and TCP/IP with no obvious problems. I have used it on a local repeater and got reports "Kenwood Quality" for audio. (I usually have ICOM Quality for audio so not sure what that meant ;-)

- Scott

> Does anyone know of mods for the Regency Model MX5000 scanner?
> de Tedd KB8NW

I found at least one old article about the RFI problem (microprocessor noise) in the Regency MX-5000 scanner. It was entitled "Curing the RFI Problem in the Regency MX-5000," written by Dave Buda, WA2RYC, and appeared in 8/84 Monitoring Times.

Portions of that article follow:

"As anyone who has used the new Regency MX-5000 knows, there's a good amount of interference radiating from its internal workings....The problem disappeared as soon as an outside antenna was connected to the unit."

"...I decided to make a simple modification that proved to be a great help in eliminating 95% of the radiation problem."

"I contacted Miller-Stephenson" (Danbury, CT 06810) and obtained a couple of cans of the RFI-conductive Coating Spray. The MS-485 spays has an attenuation of 78 dB at 1 MHz and 44 dB at 1000 MHz with a surface resistivity of 2.9 ohms per square inch."

"The manufacturer recommends you apply several light coats to obtain 1.5 to 2 mil coating."

"I removed the top and bottom covers and the front panel as well. After carefully masking the outside of these covers I proceeded to spray the inside of the covers and panels with about 4 thin coats as recommended."

"The spray dries quickly so the whole modification shouldn't take more than a half hour."

"When I replaced the covers, I simply added star lock washers between the metal chassis and the outer covers. This allowed for good contact to ground for the now-shielded plastic case."

"The modification was a success. As soon as I turned the unit on again, the RFI problem had disappeared. Bir-dies were almost nonexistent and I was on my way to scan-

ning again..."

349. Police Radar Frequency Info

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-14 14:39:30 UTC
From: sdorsey@eng.umd.edu
Message-ID: <1991Jun14.143930.28999@eng.umd.edu>
Source record: 296002
Cross-posted to: rec.radio.amateur.misc,sci.electronics

I'm working with some RAM (Radar Absorbing Material) here at work, and it occured to me that an ideal application for the stuff would be to radar-proof my car against police radar. I know police use X and K band radar to clock traffic. X band goes from 8-10GHZ, and K band something like 18-27GHZ. Now, I can get RAM that absorbs frequencies in the 8-10GHZ band with a minimum of 20dB of attenuation at 8 and 10GHZ, and 30dB of attenuation at 9GHZ. Theoretically, this will reduce the reflected signal strength on the areas covered with this material by over 100 times. This should result in much decreased range of the police radar.

I run into a problem with the K-band. It's too wide for the RAM to work effectively on. Since the K-band is subdivided into a number of sub-bands (Ka, Ku, for example), I was wondering if anyone knows which band(s), other than the Ka band (for photo-radar) the police use? Around here, K-band radar is used more frequently than X-band, so I'd feel better protected with K-band police radar protection than X-band.

If anyone else is interested in obtaining some RAM for experimentation, I can supply ordering information upon request. It costs around $55 per square foot (typically, a minimum order is 4 square feet). You don't need to cover a lot of your car, just metal surfaces that reflect radar back in the direction you're travelling (rear-view mirrors, bumper, possibly part of the hood, etc.).

Yes, you are being too sensitive.

Given that I am very busy in other fields these days, I no longer
routinely have a copy of QST around. I personally like seeing
the contents listings here so that I can see what is in it before
I put any effort into chasing down a copy.

Bill,

I called up Cininatti Microwave (1-800-543-1608) (a maker of radar
detectors) and spoke to a technical rep there about your question.
She said that their detectors listen in frequency bands centered at
10.525 GHz and 24.150 GHz, and that those bands are only a few MHz
wide.

In article <9106121204.aa08583@crdec7.apgea.army.mil> wejones@crdec7.apgea.army.mil (Bill Jones) writes:

I have been looking for an affordable spectrum analyzer, and was looking in an old EEB catalog at their ICOM 7000 accessories (I have a 7000). They offer a CRIS system with a spectral display option that uses the agc line for signal intensities, and presumably uses the CRIS capabilities to scan through the frequencies. This combination of accessories runs more than $1100 total! Why? If one has the the level converter for the 7000 (which is requires for the above anyway), couldn't one run the agc line to an oscilloscope, and scan through the frequencies of interest via home-made software (or modifications of software available by ftp). There are a variety of ways one could

I don't think that you would be ablt to switch frequency fast enough for a real scan. The best you could do would be to get a histogram and then why bother with a o-scope when you have a computer handy?

generate the sync pulse. Or for less than $300 one could buy an a-d card for the PC to take the place of the oscilloscope, in addition to providing all sorts of digital and analog inputs & outputs, sooooo, the question is; Why is this thing so expensive? Am I over-simplifing what is involved here? Is there more to the hardware than I am assuming, or are they charging mainly for the software?

GTE makes (or made) a neat little gizmo for the '7000 that uses the IF output to provide a spectrum display on a scope. A nifty tool for about $350. It paled when compared with a real analyzer but for monitoring purposes it was as good as you would ever need.
I might be tempted to part with mine as I haven't used it lately but that mostly because I haven't had a scope lately.

Can anyone experienced with controlling the 7000 by computer tell me how fast one can change frequency? If the maximum rate is as slow as the scans generated via the pushbutton controls, it wouldn't make a very useful spectrum analyzer, so I'm hoping it is much faster. Has anyone done what I'm describing here?

The normal CIV rate is 1200 baud. It can be made to run at 4800 or maybe even 9600. I think its just under a dozen bytes for a command. Lets say 10, at about 1000 characters a second, takes about 10 mS. For one increment in frequency. Now say 100 samples per scan and you weigh in at about a second. Storage scope are expensive so this doesn't sound like a good way to go.

I started building an interface to the computer from the output of the panadaptor so that I could display it on the screen. Then with a simple click of the mouse I could tune in anything I could see. Maybe when I get some more time.

356. MAJOR GEOMAGNETIC STORM UPDATE - ALERT AND WARNING CANCELLATIONS

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-14 18:13:13 UTC
From: oler@HG.ULeth.CA
Message-ID: <910614121313.272017bb@HG.ULeth.CA>
Source record: 296024

/\

GEOMAGNETIC STORM UPDATE

ALERT CANCELLATION

/\

18:00 UT, 14 June

STORM UPDATE INFORMATION:

Geomagnetic activity subsided after 03:00 UT on 14 June to generally unsettled conditions. Unfortunately, for North American aurora observers, this meant conditions would not be favorable for auroral observations. The last disturbance did not have the energy to persist until after dark. Auroral activity was significantly less active and was generally only observed over the high latitudes in a diffuse post-storm form.

We are not expecting any further terrestrial impacts from recent major flares. Yesterdays major class M7.3/2N and M5.4/1F flares are not expected to have a terrestrial impact. The storm periods have ended.

A summary of this weeks events will be presented in next weeks STFR report, which has been postponed due to the high uncertainties which existed for terrestrial activity this week.

The ionosphere has been weakened due to the recent storm activity and will require several days to recover. Conditions should be back to near-normal by 17 June.

The satellite proton event and the polar cap absorption event have ended. Proton levels are continuing to decay and are presently at approximately 5 pfu at greater than 10 MeV.

Solar Region 6659 continues to exhibit a fairly potent configuration and could still yield some isolated major flares, although the risk for major flaring and possible proton flaring is diminishing as it nears the western limb. This region is no longer in a sensitive location for producing high terrestrial impacts. The other regions visible on the solar surface are not capable of producing major flare activity.

The following alerts and/or warnings have been CANCELLED:

- LOW LATITUDE AURORAL ACTIVITY WARNING
- POTENTIAL GEOMAGNETIC STORM WARNING
- MAJOR GEOMAGNETIC STORM ALERT
- SATELLITE PROTON EVENT ALERT
- POLAR CAP ABSORPTION EVENT ALERT

The following warnings remain IN PROGRESS:

- POTENTIAL MAJOR SOLAR FLARE WARNING (PROTON ~ 25%)
- POTENTIAL SATELLITE PROTON EVENT WARNING
- POTENTIAL POLAR CAP ABSORPTION EVENT WARNING

361. VHF/UHF Capacitors.

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-14 19:22:43 UTC
From: darel@maccs.dcss.mcmaster.ca
Message-ID: <28591783.11294@maccs.dcss.mcmaster.ca>
Source record: 295948

I was wondering if anyone who has done VHF construction could share a little expertise with me. I have designed a 2m amplifier which I am now ready to build. In trying to track down some of the extremely rare SINGLE QUANTITY ceramic chip capacitors I have been completely frustrated. (As it was pointed out to me, I can get any of the caps I want if I buy reels of 4000; $600). Between Motorola documentation, and the ARRL Handbook they seem to be the only choice at frequencies above ~140 MHz (unless you have VHF reactance measuring equipment at your disposal).

At this point I had decided to resort to silver mica caps, that is until I read through a Motorola Engineering Bulletin relating their experience with silver mica capacitor's parasitic inductances. (The bulletin cited a 1000pF cap used in a design at 150MHz which was actually used as an inductor (12 nH)). If this is the case what available capacitor types are recommended (and hopefully used) at these frequencies (axial polystyrene, ceramic disc, monolithic ceramic, solid tatalum ...) ? What rules of thumb does one use when fabricating at >= VHF frequencies (design is easy :-).

If I designed a complex impedance matching network that requires a 43 pF cap, then I don't want to have to modify design values for actual values accounting for parasitic inductances.

Any thoughts would be appreciated;

Darel

362. Colo Hams: 14ers on the air

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-14 19:46:04 UTC
From: bobw@col.hp.com
Message-ID: <54420002@col.hp.com>
Source record: 295929

From: KB0CY Bob Witte Date: June 14, 1991

To: Colorado Amateur Radio Operators

Subject: Radio Active Colorado 14ers

I have been talking with a group of amateur radio operators in the Colorado Springs area about organizing an attempt to put as many 14,000 foot Colorado mountains as possible on the air this summer. The idea is that on some Saturday this summer, we simultaneously operate from the top of as many Colorado 14ers as we can, working each other and anyone else interested. Why? Because it might be fun! At this point in time, I am mostly looking for people to help formulate the basic plan -- a core group that will likely participate and can offer advice on what to do. Please pass this on to anyone that's interested.

Let me give you a rough idea of what I am thinking. There are still many open issues and I welcome your ideas.

* At a minimum, we should operate 2M FM since that is a universal, easy-to-carry mode. What else should we do? Should we try SSB on 2M or HF? Or maybe 10 GHz if we had enough equipment (Instant VUCC)?

* When? I propose that we do it on Saturday August 24th with an backup date of August 31st. Primary operating hours would be from 11 AM to 1 PM. This gives the hikers time to get up the mountain in the morning and lets them get off the top before the usual afternoon thunderstorms hit.

* It seems there are 3 classes of mountains we will encounter.
1. Drive-up mountains (Pikes Peak and Mt. Evans only).
2. 4WD Mountains (Mt. Bross, Mt. Antero, ...)
3. Hike-up mountains (most of them)

People who don't want to hike can do either #1 or #2. We need to make sure that anyone who hikes knows what they are up against. Unless you have previous high altitude hiking experience, I would not recommend it.

Pick your favorite mountain and let me know. I will coordinate who goes where to prevent multiple stations on the same mountain. Some stations may choose to stay off the mountaintops but be in a good location to work as many of the other stations as possible.

* To encourage participation, we could have a special QSL or certificate available. (I am willing to arrange this.) One idea is that we collect the logs from all mountaintop stations and have all QSLs sent to one place. Then, we issue a certificate with all of the mountains worked

listed on it.

If you are interested, mark your calendar and contact me with the following information.

* Your name and call sign
* Your telephone number
* Your address
* The mountain that you want to operate from (and any alternates).
* Equipment which you have (or could borrow) which you would be willing to haul up a mountain. 2M FM is required. 2M SSB, other VHF/UHF and microwave gear are desirable.
* Any suggestions or questions that you have.

366. Packet Cluster

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-14 22:37:00 UTC
From: 8909296@ul.IE
Message-ID: <20E40D30E02014B7@ul.ie>
Source record: 295933

Date sent: 14-JUN-1991 22:25:28

Hi!

I am trying to get a Packet Cluster going locally.
What I want is some basic info

1) What software is needed to run Packet-Cluster

2) Is the software available for different platforms,
besides PC e.g. Amiga, C64, Mac etc.

3) I read somewhere that the Packet Cluster software uses its
own protocol. If this is true, does it mean it will be
incompatible with AX25 and TCPIP as the are at the moment.

I would be grateful for any hints/tips or pointers as to
where to get this info (magazine articles etc.)

368. 02at mods?

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-14 23:31:59 UTC
From: msw1633@rigel.tamu.edu
Message-ID: <17346@helios.TAMU.EDU>
Source record: 295939

Hello all!
I am looking for the direct entry mod for the Icom 02AT. I believe that
this mod will allow me to enter both the tens and ones digits of the MHz
display. Please email if you know what it is or even better where to find it.
I know it exists, cuz some guy was charging 35 bucks to do it at HamCom in
Dallas last week. I have scanned the available ftp sites and haven't seen
it, but it could easily have been missed.

thanks

Somebody is (was) selling a supposedly stealth "bra" to attach to the
front of your car to avoid police radar. No mention of how that is
supposed to shield the roof, sides, etc. :=)

Even better was the tip in one of the popular magazines some years ago.
Remember how the allies dropped bundles of tin-foil chaff from airplanes
in WWII to foil the German radar? This "tip" was to fill your hubcaps
with shredded Reynolds Wrap to avoid the speed traps!

Why would that be illegal? He is simply adding material to his car (same as painting your car or adding ground effects). It just happens to be that police radar can not reflect from that material (unless there is a law saying that all cars MUST be able to reflect microwave signals).

By the way, what color is this radar absorbing material? Is it a paint/paste or like a thin sticker?

/\

SOLAR TERRESTRIAL BULLETIN

15 June, 1991

PROTON EVENT RECURRED

/\

ADMINISTRIVIA

Effective immediately, the Solar Terrestrial Dispatch will begin providing messages with subject headers in upper and lower case. All upper-case lettering in the subject headers will only be used for urgent or important bulletins, alerts or warnings.

SATELLITE PROTON EVENT IN PROGRESS

A satellite proton event at greater than 10 MeV recurred at 23:40 UT on 14 June. The flux increased above event thresholds of 10 pfu and is presently near 20 pfu. Decay is expected to occur on 15 June, barring possible proton flaring from Region 6659 (which is now nearing the western limb). This proton event should end later this UT day (15 June), provided major proton flaring does not develop from Region 6659.

** End of Bulletin **

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

375. Re: Communications Quarterley Table of Contents Spring 1991

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-15 13:23:34 UTC
From: Christopher.Boone@farwest.sccsi.com
Message-ID: <677042050.1@farwest.sccsi>
Source record: 295915

Guess I'll have to get my ex HR life sub now a CQ life sub changed to a Comm Quarterly (and that'll be probably NON-Life...! What a rip!)
Oh well, more money to fork out on this "hobby" just to keep up with the best technical end....

(I like the titles you posted....toooooo bad CQ itself cant be a that type of mag.....HR WAS!)

376. Re: Police Radar Frequency Info

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-15 14:11:52 UTC
From: kkim@plains.NoDak.edu
Message-ID: <10850@plains.NoDak.edu>
Source record: 295949

In article <14570082@hpnmdla.sr.hp.com> alanb@hpnmdla.sr.hp.com (Alan Bloom) writes:

:Even better was the tip in one of the popular magazines some years ago.
:Remember how the allies dropped bundles of tin-foil chaff from airplanes
:in WWII to foil the German radar? This "tip" was to fill your hubcaps
:with shredded Reynolds Wrap to avoid the speed traps!
:
:AL N1AL

interesting! could you please explain a little bit more? in case of
an airplane, a false target is generated by tin-foil chaff. however, in
case of a car, the car and reynolds wrap seem running at the same speed
and one and the same object. am i missing something here?

thanks in advance.

k kim

377. GEOCLOCK software?

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-15 16:24:51 UTC
From: sharon@unixland.natick.ma.us
Message-ID: <1991Jun15.162451.2537@unixland.natick.ma.us>
Source record: 295950

Has anyone heard of the sofware called "GEOCLOCK 4.0" by
Joseph R. Ahlgren for the IBM PC? I received a letter from a ham in
Ukraine about it. Apparently he has a copy of this software but some
of the files are incomplete, and he is seeking help getting the complete
program.

Is it shareware? If not, does anyone know how much it would cost to
purchase and where one can find it?

Thanks.

378. Re: Accurate time worldwide

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-15 17:10:35 UTC
From: wordy@bikelab.Corp.Sun.COM
Message-ID: <4403@jethro.Corp.Sun.COM>
Source record: 295951

Steven Hunter, KC6RKV requests info on low-cost GPS receivers
with computer interface.

I'm using the Trimble TANS on my bicycle -- it has an RS-422
port and outputs lat, long, el, speed, and time (to 1 microsecond).
I can recommend this unit firsthand.

Also, Rockwell has introduced the NavCore V (very tiny) and
Sony has just announced the Portable GPS Receiver Pixcess (but I don't
know if it's interfaceable). Trimble has been a leader in this
field for a long time, and is a good place to shop for various
robust GPS products.

They are at 408-730-2900.

379. SIGNIFICANT MAJOR SOLAR FLARE ALERT - IMPACT EXPECTED

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-15 18:16:23 UTC
From: oler@HG.ULeth.CA
Message-ID: <910615121623.27a001a7@HG.ULeth.CA>
Source record: 295953

-- MAJOR SOLAR FLARE ALERT --

JUNE 15, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

Region 6659 has managed to spawn another Great Flare, rated as a class X12/3B tenflare from a location of N33W69. The energy released by this event was enormous. Protons were ejected with high-energies. The cosmic ray neutron monitors registered a Ground Level Event (GLE) of +18% at 09:40 UT. The neutron monitors are back near background levels. Todays major flare was very long in duration. It began at 08:10 UT, peaked at 08:18 UT and ended at 14:02 UT on 15 June (almost six hours in duration!). There were major (importance 3) Types II and IV sweeps with this event. The integrated x-ray flux was high, at 2.85. There were fairly strong radio bursts across the spectrum. The 10 cm burst was 14,000 sfu while the 245 MHz burst was 6,400 sfu.

Near relativistic protons were observed with this event, which has produced another strong PCA event. Protons at greater than 100 MeV peaked at 77 pfu at 10:10 UT on 15 June. A brief SST Radiation Alert for radiation greater than or equal to 10 millirems was issued at 10:00 UT on 15 June. Conditions have since relaxed and this radiation hazard alert for high altitude aircraft has ended. The 10 MeV protons climbed quickly to a preliminary peak of 1700 pfu at 17:05 UT on 15 June. This peak is preliminary, since protons at greater than 10 MeV are currently running at levels near 900 pfu. Sporadic excursions above this peak may still occur.

Polar radio signal paths have again been blacked out from this last proton blast from Region 6659. Polar Cap Absorption (PCA) levels peaked at 15:55 UT with a preliminary value of about 6.3 dB. However, this peak is preliminary and excursions beyond this point may still be possible. PCA is currently running ~ 5 dB.

The 10 cm radio burst from this flare remained 100% above background levels for 123 minutes. The 10 cm burst began at 08:13 UT on 15 June.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

Despite the relatively poor position of this flare, we are considering a fairly strong possibility for a minor to major geomagnetic storm beginning sometime on 17 June. A-indices of greater than 50 may be possible. This

flare has released sufficient energy to be a threat, even at its present position. We are still performing analysis and will release an official forecast within the next few hours. If storm conditions are expected, this forecast will be released with a Potential Geomagnetic Storm Warning.

A major HF blackout has been reported by the areas which were sunlit during this event. X-rays have now dropped below M-class levels and are continuing to slowly decay back toward background levels.

Major flaring will continue to be possible from this Region, although another X-class event likely will not be observed before this region crosses the west limb. It is obviously still a potent region.

Watch for another bulletin or Warning stating the expected forcast for this event later this UT day.

** End of Alert **

I'm thinking more on the lines of dual use of existing ATV repeaters.
If they're going to take up 12 Mhz of spectrum, it would be nice
to be able to ship a database or two around when they're not showing
someone's vacation pictures.

For this application, A large block system with a lot of FEC would
be a better match than a two way packet system. Using a $200 VCR
for data storage would be a bonus, even if it did lower the maximum
possible data rate.

Since water reflects radar signals at certain frequencies, it seems to me that it ought to be possible to do "cloudbounce" in one of the higher (GHz) amateur bands. Does anybody know if this would work, or if people in fact do this sort of thing?

I suppose that frozen precipitation doesn't seem to reflect nearly as well as liquid on weather radars, so maybe that would make it difficult if the clouds were above the freezing level...

385. POTENTIAL GEOMAGNETIC STORM WARNING - FLARE IMPACT EXPECTED

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-16 01:18:05 UTC
From: oler@HG.ULeth.CA
Message-ID: <910615191805.27a002c6@HG.ULeth.CA>
Source record: 295958

/\

POTENTIAL SEVERE GEOMAGNETIC STORM WARNING

01:00 UT, 16 JUNE

/\

WARNINGS ISSUED OR IN PROGRESS:

- POTENTIAL MINOR TO MAJOR GEOMAGNETIC STORM WARNING
- POTENTIAL MAJOR SOLAR FLARE WARNING (PROTON)
- SATELLITE PROTON AND PCA EVENT ALERT

ATTENTION:

The major class X12/3B flare of 15 June is expected to produce a minor
to major geomagnetic storm. The interplanetary shockwave from this flare is
expected to intercept the Earth late in the UT day of 16 June or early in the
UT day of 17 June. Minor to major geomagnetic storming is expected to
develop. We are predicting estimated planetary magnetic A-indices of 53 for
17 June, followed by a decrease to approximately 24 for 18 June.

To aid in the interpretation of the risks involved, the following
probability chart for geomagnetic activity in each of the six main categories
follows below. The prediction is based on expected activity levels for the
next four days (to 19 June).

GEOMAGNETIC ACTIVITY PREDICTION FOR JUNE 16 - JUNE 19

Activity	Day1	Day2	Day3	Day4
Quiet	10%	05%	10%	15%
Unsettled	40%	10%	25%	40%
Active	40%	20%	35%	40%
Minor Storm	10%	30%	25%	05%
Major Storm	00%	30%	05%	00%
Severe Storm	00%	05%	00%	00%
A-Index :	17	53	24	15

So for example, Day 2 represents June 17. On this day, there is a 05%
probability for quiet geomagnetic conditions, a 10% chance for unsettled
conditions, a 20% chance for active conditions, a 30% chance for both minor

and major storm conditions, and a 05% chance for severe storm conditions. On this day, the A-index is expected to reach 53 (which is officially a low-intensity major storm). However, there are equal probabilities for minor to major storming. Taken together, there is a 60% probability for minor to major storming, or a 50% probability for active to minor storming, or a 35% probability for major to severe storming. However, since there is only a 05% chance for a severe geomagnetic storm, conditions are likely to remain below severe storm levels. So from this chart, Day 2 will be the most disturbed day, with only a 15% probability for quiet to unsettled conditions.

If used properly, this prediction chart can provide valuable information on potential activity. You should use it in making your own judgements regarding the potential activity on these days.

A Low Latitude Auroral Activity Watch has been issued for the UT day of 17 June. Conditions may become favorable for low-latitude auroral activity on this day.

HF propagation conditions will be poor on 17 June, provided an interplanetary shock arrives as expected. If a shock fails to arrive, conditions will continue at fair to good. Near complete absorption of radio signals will continue over the next several days over polar paths.

There may be an opportunity for some VHF backscatter communications on the UT day of 17 June, provided we are affected by todays major flare. If we are not, no backscatter or other VHF anomalies are likely to be observed.

Conditions are expected to improve on 18 June.

PLEASE SEND ANY REPORTS OF DEGRADED RADIO PROPAGATION CONDITIONS, SIGHTINGS OF AURORAL ACTIVITY, VHF BACKSCATTER COMMUNICATIONS OR OTHER ANOMALIES TO: OLER@HG.ULETH.CA (INTERNET), OLER@ALPHA.ULETH.CA (USENET), OR (SNAIL-MAIL) TO: SOLAR TERRESTRIAL DISPATCH, P.O. BOX 357, STIRLING, ALBERTA, CANADA, T0K 2E0. PLEASE INCLUDE THE DATE AND TIME (LOCAL AND UT) OF THE OBSERVATION, THE APPROXIMATE LATITUDE/LONGITUDE OF THE OBSERVATION LOCATION, AND A BRIEF DESCRIPTION OF THE PHENOMENA OBSERVED. WE THANK ALL THOSE WHO TAKE THE TIME TO SEND IN OBSERVATIONAL REPORTS.

/\

386. LOW LATITUDE AURORAL ACTIVITY WATCH - VALID FOR 17 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-16 02:53:02 UTC
From: oler@HG.ULeth.CA
Message-ID: <910615205302.27a00353@HG.ULeth.CA>
Source record: 295960

/\

LOW LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 02:45 UT, 16 JUNE
VALID: 17 JUNE

/\

ATTENTION:

The major class X12/3B flare of 15 June is expected to produce a minor
to major geomagnetic storm. An accompanying minor to major auroral storm is
also anticipated for 17 June. The auroral activity may be sufficient to be
observed over the central to southerly middle latitudes. There will be a
slim chance for lower latitude auroral activity.

To aid in interpreting the probabilities, the following probability
chart has been made available.

VISIBLE AURORAL ACTIVITY PREDICTION FOR NORTH AMERICA JUNE 16 - JUNE 19

NOTE: The days given below are UT days. Day 1 corresponds to the UT day of
16 June. For North America, Day 1 begins at 18:00 MDT, 19:00 CDT, etc, on 15
June. Day 2 begins at 18:00 MDT, 19:00 CDT, etc, on 16 June. Take this into
consideration when interpreting the chart below. The chart represents
the expected probabilities for observing visible auroral activity (during the
night hours), under a dark sky with good atmospheric conditions. Use the
appropriate section of the chart corresponding to your latitude.

The latitude boundaries are defined (approximately) as follows:

NORTHERN HEMISPHERE SOUTHERN HEMISPHERE
High latitudes >= 55 deg. N. | High latitudes >= 55 deg. S.
Middle latitudes >= 40 < 55 deg. N. | Middle latitudes >= 35 < 55 deg. S.
Low latitudes < 40 deg. N. | Low latitudes < 35 deg. S.

These are not precise boundaries because auroral activity is more closely
associated with geomagnetic latitude than with geographic latitude.
Nevertheless, the geographical latitude boundaries given above are good
approximations and are used in the chart below.

Latitude	Intensity	Day1	Day2	Day3	Day4
	High	00%	75%	30%	05%
High Latitude	Moderate	15%	20%	40%	30%
	Low	45%	05%	30%	55%

	Not Visbl	40%	00%	00%	10%
	High	00%	70%	15%	00%
Northerly Middle	Moderate	05%	20%	40%	20%
	Low	40%	10%	40%	40%
	Not Visbl	55%	00%	05%	40%
	High	00%	20%	05%	00%
Central Middle	Moderate	00%	30%	20%	00%
	Low	10%	40%	40%	30%
	Not Visbl	90%	10%	35%	70%
	High	00%	05%	00%	00%
Southerly Middle	Moderate	00%	15%	05%	00%
	Low	00%	30%	20%	05%
	Not Visbl	100%	50%	75%	95%
	High	00%	00%	00%	00%
Northerly Low	Moderate	00%	05%	05%	00%
	Low	00%	35%	10%	00%
	Not Visbl	100%	60%	85%	100%
	High	00%	00%	00%	00%
Central Low	Moderate	00%	00%	00%	00%
	Low	00%	30%	10%	00%
	Not Visbl	100%	70%	90%	100%
	High	00%	00%	00%	00%
Southerly Low	Moderate	00%	00%	00%	00%
	Low	00%	10%	05%	00%
	Not Visbl	100%	90%	95%	100%

For example, the probability for observing auroral activity over the southerly middle latitudes (near the 40N latitude boundary) on Day 2 (or 17 June, UT time) is as follows. There is a 05% chance for observing high-intensity auroral activity over these regions on 17 June, a 15% probability for observing moderate levels of activity, a 30% probability for observing low levels of activity, and a 50% chance for being unable to observe any auroral activity at all. Taken together, there is a 45% probability for observing low to moderate auroral activity, a 20% probability for observing moderate to high auroral activity, and an 80% probability that activity will either be not visible or of low intensity on 17 June.

This chart is designed to give the observer all of the information needed to make judgemental decisions. Using this chart, the observer will know exactly what the forecasters believe may happen and whether there is a high or low confidence in predicting specific levels of activity for specific regions.

The UT day of 17 June (or, for North American observers, the local evening hours of 16 June) is expected to provide the highest probabilities for observing auroral activity over the lower latitudes. Lunar phase will not interfere with attempts to view auroral activity.

This is expected to be the last opportunity to view flare-induced auroral activity before Region 6659 departs around the west limb.

Photographic observers in the middle to low latitudes where auroral activity is difficult to spot may want to take long-exposure photographs of the northern to northeastern horizon even if auroral activity does not become optically visible with the unaided eye. Often, long-exposure photographs taken without optical confirmation yield positive results.

For any of you who obtain optical or photographic confirmation of auroral activity (particularly over the lower latitudes), please send a note to: oler@hg.uleth.ca, or to: oler@alpha.uleth.ca, or write to: Solar Terrestrial Dispatch, Box 357, Stirling, Alberta, Canada, T0K 2E0. We are interested in obtaining photographic copies of auroral activity viewed over areas where it is normally not seen. We thank all those who take the time to send in confirmation (or non-confirmation) reports.

** End of Watch **

>> Aren't such applications illegal?

>Why would that be illegal? He is simply adding material to his car...

Actually, legally, under several conditions that is illegal in this
country. If the state can prove beyond a reasonable doubt that the
accused added such material to the car with the intention of impacting
the states ability to inform uniform regulations, then it is illegal.
However, if it is added to the car simply because it looks neat or he
likes it, then there's nothing wrong. Further, there are actually about
a dozen different crimes that would be committed, if proof existed.

I just went to HRO the other day and just happend to walk pass the HT display case and this small radio caught my eye. Yaesu has come out with a new 440 and 2m handy talkies. They are about the size of an icom 2sat. The ones I saw did not have the DTMF pad. The 440mhz model is FT76 at $319.00 and the 2m model is the FT26 for $300.00. They did have any spec sheets on any of the models yet. Stay tune for a new dual ht to replace the FT470!! I also saw a used R1 forsale for $300.00.

P.S. Finally got my FCC papers in the mail, for those keeping track, it took exactly 5 weeks, now lets how long it takes for upgrades.

391. Buying an ALINCO 590 ? - Buyer Beware !!!

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-16 10:34:00 UTC
From: RHAREL%FAB8@sc.INTel.COM
Message-ID: <0B22113D600000AE@sc.intel.com>
Source record: 295962

(FORWARDED FROM THE 4Z4SV BBS - JERUSALEM, ISRAEL)
==========
The following information may be of interest to those considering purchasing or already owning an Alinco DR590T dual band transciever. The original owners manual has been supplanted by a new one written for Alinco by Jay Appell, KA1SNA. It is called the ADVANCED USERS INSTRUCTION MANUAL, and I believe it will answer about 95% of the questions I've seen appearing about this unique rig, and finally supplies some parts layouts and circuit diagrams, as well as basic adjustment procedures.
>>>>>>>>>> HOWEVER, A CAVEAT: <<<<<<<<<<
I would like, however, to point out a BUG IN THE RIG'S MICROPROCESSOR which is mentioned in the manual, believe it or not! On page 33, it is pointed out that the Autodialer does not function properly when used with PL encode or decode invoked, except for 8 of the 38 possible PL tones. They suggest a way around this, but I have discovered that THE BUG IS BIGGER THAN THEY THOUGHT !
It turns out that one also does not have full remote control of the rig when any of the 30 PL tones are invoked. You can, for example, initiate crossband repeat, but not cancel it. Since you can't operate any other remote control function while the rig is in crossband repeat mode, this sort of negates the most unique feature of the rig, and one of its biggest selling points.
It's my feeling that this is a basic deviation from the advertised capabilities of the rig; I would hope that Alinco, having released it into the market this way, and themselves acknowledging the existence of the bug, will come up with a fix for this basic problem with the rig and either recall or repair those that are already out. I will be sending a letter similar to this message both to them and to QST.
For anyone else wanting to get the new improved real English manual, or wanting to write to Alinco about their problems with the rig, the address that is listed in the new manual is:
Gregory Pearson
General Sales Manager
Alinco Electronics, Inc.
438 Amapola Ave. #130
Torrance, Cal. 90501
Their phone # is : (213) 618-8616
Anyone knowing of a users group or publication with regard to this rig, please inform me. I am particularly interested in mods related to allowing remote control without DSQ being required before every transmission, and any integration of this rig in remote base applications.
P.S.- They have come out with a free mod kit to improve the crossband

audio. It works, but the installation of the two chip capacitors is akin to trying to solder a grain of salt to the tip of a needle. Good luck !
73,
Avi Esterson

RACESBUL.174 DATE: June 17, 1991
SUBJECT: Equipment for emergency responders - Part 2

OTHER ITEMS TO CARRY OR WEAR:
Clothing to suit the weather or climate. If you wear
eyeglasses be sure to carry an extra pair. Wear an accurate,
rugged, and easy to read wrist watch.
If you have a handheld transceiver carry a battery pack that
will hold double A alkaline batteries. Nicad battery packs need
charging often and usually take hours and require 110 volts AC.
Double A alkaline batteries are usually readily available and
only take a few minutes to change. Keep your nicad pack with you
for backup. Keep it in a container by itself or cover its
terminals with tape; if they short out it can burn or explode.
Carry a speaker mike that can be clipped to your clothing
where it can be easily heard and reached. Boom mikes work well if
you like them but never, NEVER use VOX. If you are in a noisy
environment they can key your transmitter and you may not know
it. This could cripple communications and be potentially
embarrassing.
Carry a police whistle. These are good attention getters and
could be used in many ways. The handiest place for it is on a
chain around your neck and placed under your shirt or blouse out
of the way.

We are interested in setting up some point to point links running 64kbps (for digitized audio). Does anyone know what is available for this?

If we could get wide-band radio equip (don't have time to learn and build GHz range equip), the rest could be done. Alternatively, high bit rate modems over narrow band would be okay. Has anyone done work on high bit rate modems using techniques that assume a very good SNR?

Active jamming of radar signals is illegal, passive absorbtion should not be. So far I have not seen any requirements for cars to have a minimum reflectivity.

I saw mention that 3M had sold its Stormscope division.
This device is apparently a very useful adjunct to weather
radar when navigating through/around thunder storms.

As I understand it, the thing 'listens' to lightning static
and generates a radar-like display.

Anybody out there famailiar with this gizmo?
What frequencies/antennas does a stormscope use?

Thanks in advance,
Charlie

398. USAF MARS welcomes no-code Techs

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-16 19:50:09 UTC
From: 1843eip@hickam-emh.af.mil
Message-ID: <9106161949.AA12156@ucsd.edu>
Source record: 295968

The following is quoted from the USAF MARS Broadcast nr 21, 5 Jun 91:

"Item 040: New (No-Code) Technician License. Morse Code (CW) is not a requirement for MARS membership. Amateurs holding the new no code Technician FCC license are eligible for membership in Air Force MARS providing the following criteria are met: have the capability to operate on USAF MARS high frequencies in accordance with current directives, complete appropriate training as required, and maintain established quarterly participation requirements. Obtaining MARS membership by falsely stating on DD Form 630 that HF capability exists is a serious infraction and will not be condoned. Prior to forwarding, the SMD (State MARS Director -- ed.) will verify accuracy of DD Form 630 information submitted by applicants. (signed) Chief, USAF MARS."

So there you have it. As usual, anyone interested in USAF MARS can e-mail me for more info.

The implications of the first statement in the quoted item, if any exist, are left as an exercise to the reader :-).

Yes, sort of. Some folks in Japan were experimenting with ATV tx and rx gear lashed up to a 10Ghz link built around a pair of Gunn units and lots of plumbing about two years ago. I don't know how far they got, they were trying to do 10Mbit/sec, and the ATV-derived modulators weren't that fast.

>strength on the areas covered with this material by over 100 times. This
>should result in much decreased range of the police radar.

I recall an article about making a stealth RX-7 a few years ago. Part
of the method was to use radar-absorbing foam. The most effective
application of this was to the front end of the car where the bumpers
and hood presented a near vertical reflector back to the radar source.
Naturely the article was called something like "The Worlds Oldest
Trick - Foam Under the Bra".

The author went on to classify the various radar reflectors he found
on the car. The biggest two were the radiator and the seat backs.
Angling the radiator down by a few degrees and replacing the factory
metal-core seats with fiberglass reinforced ones did worked wonders
for the author.

I have been trying to understand this. Sure, there are VHF (and UHF?)
frequencies for MARS, but since it states 'You must have HF capability'
and with the added warning about the truthful testimony of same...

Well, if 'HF' means <30Mhz, then it's a non sequitor. Unless SWL is a
'HF Capabilty'

Hmmmmm, maybe that's it? If you've got a general coverage (or whatever) HF
reciever, then you can answer that you do indeed have HF capability?

The exact wording of the form would be helpful.

Someone explain this to me :)

>What frequencies/antennas does a stormscope use?

When in doubt, open your big mouth and insert foot. I'll give it a try. 8-)
As I understand it, the storm scope is a frequency passive, non-intrusive
type device. The 'input' is a set/series of different rc filter sets. The
time correlation, base frequency, and frequency correlation information are
put together, compared or run through a mathematical model, and the resulting
black magic ends up with a time-delayed, averaged 3d display.
Static electricity is formed in all weather fronts. SOme of this radiates
in the form of RF. The amplitude is a indication of force/severity, short
time intervals between bursts is another. frequency is a indication of
altitude, and the echo off the earth (at certain freq's) and echo off the
atmosphere (at certain frequencies) are good triangulation references.
Taking that info, and adding a time and location averaging to identify
or eliminate a 'bad' or error data point, allows a great deal of freedom
in allowable variance. The end result, the averaged information is used to
form either a monochrome or color-highlighted/scaled-monochrome scope display.

From my observations the only things they can get you for is actively recieving or transmitting radar rf (read jammers, etc) Passive stuff should be fair game. After all, there are no laws stating that you can't absorb rf. (as far as I know) Someone please correct if they know of such laws regulating absorbtion. I believe there are none simply because it has never come up.
Regards,
Gordon.

Message-ID: <9106170838.AA04621@s5000.RSVL.UNISYS.COM>
Source record: 295886

After 30 years of hamming I finally live somewhere where I can put up a tower.
I've never paid any attention to them and never put one up, although I did
help a friend dig the holes for the base and guy anchors for a 90' tower once.

Anyway, I'd like to go up about 60', with a minimum of fuss and expense, and
with the greatest (reasonable) assurance that it won't fall down.
Lot size and layout make me think I have to use a crank-up tower; there isn't
enough room to guy a tower, and besides, I don't think I could climb a 60'
tower.

Any information about what brands work, which ones to avoid, usefull techniques
in raising them and keeping them up would be appreciated.

Thanks,
Bert Hyman W0RSB

THe primariy purpose of MARS is traffic handling on HF frequencies.
VHF is looked upon as a support for that service. Training nets are held
on HF frequencies. Therefore, applicants must be able to check into the
nets and need both transmit and receive capabilites. If you like HF
operation, this is one way to get it without code, and gain a lot of
vaulable operating skills as well. I had a ball running phone patches
to S E Asia and Europe during the Vietnam war with only a Tech license.

Hello!

I am interested in getting my Ham Radio liscense, however, before I do so, I need to know if it would be worth getting before I take a long trip to the Southwest or after I do. What is the Ham "population density" in the southwest and Mexico? I will be travelling by bike so most likely I will only be able to operate a 2 meter rig. (Unless there are other _really_ portable units available for 10 meters &c. Are there?) I would like to get my liscense before I go if I can be assured that it would be worth it and that I won't be hauling around extra pounds of gear with no one to talk to.

How about repeaters in the southwest? Are there many? One of the reasons I would like to have a 2m rig because then I can communicate via packet radio with a computer at home. (I will have a notebook computer with me.) Is this possible? How about Internet access while I'm on the road?

What kind of problems (if any) pop up when travelling across the border into mexico? Do I need to prearrange something?

One of the greatest need that a radio would fulfil is communication. (Obvious, no?) I will be on the road with a friend for about 9 months. During this time I'd hate to have a problem like a broken leg and have to _ride_ 60 miles to find a desert pay phone. Another reason is because it would be really nice to have "contacts" on the way.

However, if the population of hams is faily low, I think that I will wait until sometime after the trip to make the expenditure.

As to having the correct time, since we keep the U.S. Master Clock, in the U.S.
we have the correct time by definition! :-) But, since we have ~30 Cesiums
~10 Hydrogen masers and 4 Stored Ion Devices, we're also in the position of
the old saying: "A man with one clock knows what time it is; a man with two
is never sure".

A note about UTC: The major difference between UTC and previous time scales
(at least to the casual user) is the "leap seconds". UTC is based on atomic
clock time scales, but is corrected to remain within 0.8 seconds of the
Earth Rotation time (for ease of use for navigation) by adding or subtracting
1 second as appropriate. The preferred times to do this are at the end of
December and the end of June (although one could be inserted or removed at
anytime should it be needed). The previous time scales actually diddled the
clock rates to match the Earth rotation rate, which made it difficult to
compare between laboratories or determine exact epochs.

The decision to invoke a leap second is made by the International Earth Rotation Service (IERS), the central bureau of which is located at Paris Observatory.

For historical and practical reasons, in the U.S., the authority for Time Zones and Daylight Time belongs to the Department of Transportation.

>> I'm working with some RAM (Radar Absorbing Material) here at work, and
>> it occured to me that an ideal application for the stuff would be to radar-
>> proof my car against police radar. I know police use X and K band radar
>
> Aren't such applications illegal?

HaHaHaHaHa!..... No, these things are not illegal, and I
am not laughing at that. The thing about having RAM is fine and
dandy, but as you will find out (just as I did) is that the
shape and size of those things are so funny, your car will look
like a chameleon with overgrown spikes. The size: about 2 feet
high, and shaped like a pyramid. Hope you can visualise this.
Your aerodynamics get all messed up, you get wind whistle, and all
kinds of unwanted stuff. And the worst part of it is that it will
still not save you from radar. Why? Because there will still be
parts of your car which will not have RAM on it. Like your
windshield, or for that matter, lights' lenses.

I attended a seminar at Univ. of Michigan, and the Prof gave a
neat lecture about radar, and told us about how those things
worked, and what you can do about it. There is only one fool proof
way to stop getting a speeding ticket. And that is to use transit.
:-)

The only thing that is illegal, is to transmit. You can receive
or absorb all you want.

But don't listen to me. Have fun! :-)

I think it if very clear - you must have the ability to TRANSMIT and RECIEVE on HF frequencies. Bear in mind the frequencies used are outside the normal ham frequencies and are not bound by part 97, hence a no-code tech would be able to operate on these frequencies with out violating the part 97 rules on HF operation. Also the MARS frequencies tend to be only net operations...no CQ DX type operation is allowed and no idle chatter chit-chat operations allowed.

OK, I am ready to have an argument on this one. What is wrong with the expression WE? I take that as myself and my station, the collective describing not only the station operator but the station itself, and any other who may operate it. As long as the FCC does not consider me to be KA1UTU but my station to be KA1UTU wheras I am Luigi Giasi the term WE suits QSO info fine. Besides, I have always felt that my station had a life of it's own sometimes (heck, I yell at it enough... well OK mostly just the rotor box & rotor..especially if it conks out in the rain or late at night which is when they always do).

I suppose somebody will try to analyze me on this one, so let me say that it's a habit I picked up on the amateur bands and that I haven't found a way to tactfully tell members of my family that they use incorrect english, never mind an amateur I have just met (with possibly many listening in)

Some people are nervous unless we all act and think the way they do, even though describing ones self in the plural may be considered a bit haughty or self-important, it shouldn't ruin your day.

Greetings,

I'm interested in getting my amateur radio license. I'm going to be taking a year off from college and riding my bicycle in the southwestern U.S. and Mexico. I'm interested in taking a radio with me for many reasons. First of all it would be a good safety measure. Secondly I have always wanted to get a license. Thirdly it would be nice to have local contacts in the areas I want to visit to direct me to places to see, things to do &c. Fourthly, riding bike for 8-10 hours a day often gets monotonous in deserts, plain states &c. And number five is because I would like to maintain my connection to the Internet if possible so that I can relay some of my projects that I'm working on without having to use phone lines. (We will be carrying a notebook computer.)

I have several questions that I have to address. First of all, are there many hams in that area? How about repeaters and gateways? Can I rely on a good two meter setup, or should I look for something else? How portable can I be? Has anyone else done this? How do I mount an antenna on a bike with some degree of stability? What about crossing into Mexico and other south american countries? What type of arrangements must be made? Can I somehow go solar powered without much modification to equipment?

If you have answers to these questions or have something that I might use, PLEASE drop me a line. Thanks much.

Jonathan Bucki
St. Olaf College

P.S. If anyone living west of the Mississippi and north of Panama has any available back yard space for two, poor college students on bikes, drop me a line. We do windows!

426. Near Vertical Incident Skywave - NVIS

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-17 18:40:33 UTC
From: gwalsh@kilroy.jpl.nasa.gov
Message-ID: <1991Jun17.184033.6169@elroy.jpl.nasa.gov>
Source record: 295892

NVIS - What is it ???

I've got a friend, Ralph Cooper - N6NYK, who's been doing a lot of research into this topic lately. Seeing how I've got a connection here to the Internet, I thought I could help him out by posting a message here.

Near Vertical Incident Skywave is a pretty neat technique that can put a repeater to shame (except for the quality of FM over SSB). NVIS allows an someone with a HF radio to achieve solid communication over a radius of about 200 to 300 miles with almost constant receive signal strength throughout the circle traced out from the originating point.

From what I understand, the Marines and Army Air Force are using it. The Soviets began using it in the mid 1970s (around the time we started getting real heavy into satellites and repeaters) when they thought their satellites might be shot down by the U.S.

The way it works is to place a horizontal 1/2 wave dipole about 30 feet above the ground (and parallel to the ground). NVIS works best on 40m during the day and 80m during the evenings and night. 30 feet above the ground seems to maximize both bands for vertical propagation. (I'm not sure if you cut a 1/2 wave on 80m or 40m, or just have two antennas out there).

This will allow your RF to propagate upwards, bounce of the appropriate layer in the sky and come back down. As a result, you can be about 200 or 300 miles away and get a really good signal!

Other antenna configurations are the inverted inverted-V and the regular inverted-V with a 5 or 10 foot sag in the middle.

From what I understand, stations near the equator should orient their antenna north/south while stations elsewhere can orient it anyway.

NVIS really shines when you are using this technique in mountaineous areas where repeaters may not cover all of the canyons, etc. That brings up another point -- NVIS works wonders in canyons.

NVIS also allows you to hide antennas and is less susceptible to jamming.

Anyway, given that introduction to NVIS. I am wondering if anyone else has any experience with it or information about it. If so, I'd like to hear about it!

Thanks!

Simple. You must have HF capability (this includes Xmit). Just because
you don't have permission to xmit in the ham bands on hf doesn't mean that
you can't own a xmitter! If you wanna join mars, buy an HF rig and use it
only for mars. No HF rig....No problem....No Mars ticket .....

My memory is fuzzy on this. At the 1985 (I think) Microwave Update
in Estes Park, CO. Tony Bickel, K5PJR (again, I think) gave a talk about
construction of a 432 to 5760 Mhz transverter He also spoke about using
"scatter mode" propagation for increasing the distance a person could
communicate in the microwave region. A tape recording of a CW QSO was played
during the presentation. The signal sounded like keyed white noise
i. e. "whiiish whish whiiish whish whiiish whiiish whish whiiish".
This was due to doppler from the turbulance in the thunderhead being used as
the reflector.

>of the files are incomplete, and he is seeking help getting the complete
>program.
>
>Is it shareware? If not, does anyone know how much it would cost to
>purchase and where one can find it?

The following files are available via ftp
anonymous login to 'wuarchive.wustl.edu' under
subdirectory /mirrors/msdos/graphics:

Filename Binary Size Date Desc.
------------ - ------ ------ -------->
GEOCITY1.ZIP B 4115 910424 GEOCLOCK - List of World Cities with Lat/Long
GEOCITY2.ZIP B 19063 910424 GEOCLOCK - MANY more cities with lat/long
GEOCITYS.ZIP B 10620 910425 GEOCLOCK - more cities with lat/long
GEOCLK42.ZIP B 147886 910424 World map w/day-night terminator,times,EGA/VGA
GEOMNO42.ZIP B 97522 910424 GEOCLOCK v4.2 for CGA/HGC/etc. Needs GEOCLK42
MAPS3-5.ZIP B 41905 910424 GEOCLOCK - Maps 3, 4, and 5

This is a partial set, it does not contain the ham radio database and other
useful features which are avaialable for a fee. I believe the $45 mentioned
previously is a bit low. The full compliment e.g., newest version, enhanced
package, ham radio data base, is closer to $70. The above files comprise
a "teaser" to whet your apetite...

You might try Microwave Components of Michigan, 313-753-4581.
He has most values available.

I don't know if they are still available, but Communications
Specialists, Inc (800-854-0547, 714-998-3021) used to sell a kit
of chip caps, 5 each of every 10% value from 1 pf to 0.33 uf plus
extras in the 1xx values. The kit was $50. I vaguely recall
that they sold small quantities of single values, too, but don't
quote me on that.

All they are saying in their regulation is that one should not try to join MARS, claiming to have HF capability (= receive/transmit) on the MARS band, but not really have this capability.

Don't try to read more into this then is meant.

Jerry Simonowits

>

There is a shareware version of Geoclock, but it's an older version and I would strongly recommend registering and becoming current. The basic Geoclock package goes for $30, and in my view it ties CT for the best software bargain going. With the basic version, you get about 50 different maps covering both different projections and different areas of the world. To give you a flavor of what you can do with it:
- Define lat/long coordinates for locations and you can have it display them on a map along with the local time;
- It plots the gray line in real time; you can speed it up to watch the gray line at times in the future;
- You can successively zoom in on a location and get an exploded view of the surrounding area;
- You can move a couple of cursors around on a map and get an instantaneous readout of the great circle distance between the two;
- On each map, you can designate a reference location. For that reference point, it gives the time of local sunrise/sunset and a continuous updating of the azimuth/elevation of the sun.
There is much more to this thing--the user manual is a good 50 pages or so. If you're a DX'er, it's invaluable. Quick, now, when do you want to set up a sked on 80 with 8R1J? Geoclock can help you in real time, whereas PacketCluster will take so long that Peter will get away before you can come up with a time for him.

In addition to the basic package, there is the "ham package", which is an extra $30. For that, you will get an azimuthal equidistant projection centered on your QTH. Type in a prefix and up pops the beam heading to the needed one, the long path heading, his short path heading, his long path heading, and the great circle distance between you and him for both short and long path. The great circle between the two shows up, of course, as a straight line through your QTH. The grey line is also plotted on this projection. It's handy for looking up beam headings, but I'm not wild about it.

I don't have the address handy, but you can dial into Joe's bulletin board at 703-241-7980 (8-N-1, 1200/2400). I suspect he'll take an order on a charge card. Please excuse if this sounds like a paid advertisement--it's not. I just think Joe puts out a great piece of software.

BTW, Sharon, good going on a great article in QST!

433. New Regs Concerning Handicapped/Code Tests

Anyone got a machine-readable copy of the new FCC amendment to the rules passed recently regarding the handicapped and waiver of code tests? Need a copy PDQ. Thanks in advance.

I am looking for the modification for a Radio Shack PRO-32
handheld scanner. I'd like to increase scan speed and freq. coverage. If
someone has this, can you please send it to me, or tell me where I can get
ahold of one.. Thanks!!

436. GEOMAGNETIC STORM ALERT - MINOR STORM IN PROGRESS

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-17 22:17:04 UTC
From: oler@HG.ULeth.CA
Message-ID: <910617161704.27a0075b@HG.ULeth.CA>
Source record: 295907

/\

GEOMAGNETIC STORM ALERT

/\

Issued: 22:00 UT, 17 June

ATTENTION:

A minor geomagnetic storm is presently in progress. Minor to major geomagnetic storming has been observed over the last three hours. The interplanetary shockwave from the last large class X12/3B flare arrived at 10:18 UT on 17 June. Activity should continue at minor to major storm levels over the next 12 to 18 hours, afterwhich a return to more dormant levels should materialize.

The Low Latitude Auroral Activity Watch has been extended to 18 June. Activity may become favorable for auroral observations over the central U.S.. There is a slight chance for visible auroral activity in the lower latitudes. However, storming may become increasingly dormant over the evening hours if this present disturbance does not persist. The UT day of 18 June will be the last day for possible significant storm periods and auroral observations over the lower latitudes. Conditions will improve noticably on 19 June and auroral activity will be confined to the high latitude regions.

HF degradation has been observed over the past 12 to 18 hours. A minor ionospheric storm is in progress which has lowered MUFs and increased levels of distortion. These conditions should persist until later in the UT day of 18 June, when conditions should begin to improve. The PCA event over the polar regions has almost ended and will officially be ended by 19 June.

There remains a possibility for VHF backscatter communications over the high and middle latitude regions for 18 June. Conditions are now fairly favorable for localized VHF backscatter over limited areas.

** End of Alert **

437. Re: How do 3M Stormscopes work?

>...3M...sold its Stormscope division. ...(a) useful adjunct to weather
>radar when navigating through/around thunder storms.
>...the thing 'listens' to lightning static and generates a radar-like display.
>What frequencies/antennas does a stormscope use?
>

I had the good fortune of attending an air show back in 1980 where
the Stormscope was first being shown (I beleive the manufacturer
was Ryan at that time - later bought by 3M). There were manufacturer's
reps there and the following is what I remember:

The unit has a small, flat antenna which attaches to the outside of
the fuselage of the aircraft, usually on the bottom. The unit senses
static electricity, mostly generated from wind shear. It was told to
me that whenever two currents of air shear (as in a storm), there are
electric currents which comensurate with the rate at which the opposing
winds are meeting. Lightening is apparently not the primary focus of
this instrument.

I don't know (or remember) much more.

438. LOW LATITUDE AURORAL ACTIVITY WATCH UPDATE - 18 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-17 22:27:24 UTC
From: oler@HG.ULeth.CA
Message-ID: <910617162724.27a0081d@HG.ULeth.CA>
Source record: 295905

/\

LOW LATITUDE AURORAL ACTIVITY WATCH

UPDATED: 22:00 UT, 17 JUNE
VALID: 18 JUNE

/\

ATTENTION:

The Low Latitude Auroral Activity Watch has been extended to 18 June. Conditions may become favorable for auroral activity observations over the lower latitudes on 18 June. Minor to major geomagnetic storming is currently in progress and is expected to continue for the next 12 to 18 hours. By 19 June, conditions are not expected to be favorable for lower latitude auroral observations. The UT day of 18 June should be the last day for possible low latitude auroral observations.

This watch is valid until 00:00 UT on 19 June. At that time, it will be updated or cancelled.

** End of Watch **

Wondered if anybody else heard the horrid abusive language being used
on 28.325 Sunday just around lunchtime (which for us would be 1700-something
UTC) ?

If anyone has an idea what these persons callsigns might be, please forward
them to me.....

For those who didn't hear it, I am dubious that the phrase "queer bastards",
among others, is really appropriate to Amateur Radio. The fellow from
the FCC who tuned in and monitored it was in agreement....

SB ALL @ AMSAT $ANS-166.01
FD '91 OSCAR STATION PLANNING

HR AMSAT NEWS SERVICE BULLETIN 166.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 15, 1991
TO ALL RADIO AMATEURS BT

AMSAT Urges All To Include An OSCAR Station During FD '91 June 22-23

Field Day '91 is only one week away and AMSAT once again encourages
all radio amateurs involved in FD planning to consider including an
OSCAR station at the FD site. A simple OSCAR station could easily be
set up for Mode A (up 2M, down 10M) with a 2M vertical and a dipole
antenna, a HF rig for the downlink, and a 2M all-mode rig for the
uplink. To help facilitate FD planners, a complete frequency guide
for RS 12/13 will be included in this week's AMSAT News Serve (ANS)
bulletins. Also, a partial listing of AOS/LOS times are included
for selected cities across the US. For those who are near to any
of these cities, the times should be close enough for FD purposes.
The selected passes were chosen because of their high elevations
during the FD operating period beginning next weekend at 18:00 UTC
June 22-23. Using the non-tracking antenna system mentioned above,
QSOs on RS 12/13 should be very easy even in the FD environment.

For those who will not be out at a FD site but will be at your OSCAR
station, you can help those at FD sites make OSCAR contacts. Please
remember that there may be "novices" on the OSCARs that weekend who
will need your help as they make that all important FD contact for
bonus points under "less-than-optimium" conditions. For those who
will be at home during FD, you too can join in the fun by running
Class 1D during FD. As amateur radio satellites become more
numerous, their utility during emergencies can be demonstrated during
an FD experience. So "good luck in the contest and QRZ FD!"

SB ALL @ AMSAT $ANS-166.04
NEW AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 166.04 FROM AMSAT HQ
SILVER SPRING, MD APRIL JUNE 15, 1991
TO ALL RADIO AMATEURS BT

New AO-13 Spring Schedule, AO-10 Not Presently Available

The newly announced AO-13 transponder schedule which is expected to commence
19JUL91 and will continue thru 12AUG91 is as follows:

Mode-B : MA 000 to MA 165 !
Mode-JL : MA 165 to MA 190 !
Mode-LS : MA 190 to MA 195 !
Mode-S : MA 195 to MA 205 ! <= Mode-B transponder is OFF !!
Mode-B : MA 205 to MA 256 ! Perigee eclipses, (max 29 mins)
Omnis : MA 240 to MA 060 ! until end September.

Please DON'T uplink to mode-B 195-205; it interferes with Mode S

Once Magnetorquing is completed the anticipated Spacecraft attitude will be:

BLON = 210 BLAT = 0

James Miller, G3RUH, will be commanding AO-13 to adjust the spacecraft's angle
to the sun to allow for maximum illumination of the solar panels. This is
accomplished by sending current through specially designed electromagnets
aboard AO-13. This procedure is known as magnetorquing. As the satellite
approaches perigee (the closest point to earth during the orbit) the
electromagnets interact with the earth's magnetic field. This results in
James being able to maneuver AO-13 (ever so slowly) in such a way as to allow
the solar panels to receive a greater amount of sunlight.

For the first time this "routine" maneuver is complicated by the need to
magnetorque through solar eclipses from MA 246-256. During eclipses the
satellite loses its celestial marker (the Sun). In addition, when BLON
reaches 203 degrees, Sun Angle will be less than 8 deg, and the Earth sensor
will trigger on the Sun, which causes James to temporarily lose the attitude
determination capability. Thus the last leg of the attitude change will be
done "open-loop". James will be aided by a new magnetorquing simulator MAGSIM
to help him predict how the spacecraft will react during the magnetorquing.

Stay tuned to ANS to see how he does.

Currently, OSCAR-10 is not receiving sufficient solar panel illumination.
PLEASE DO NOT attempt to use OSCAR-10 until further notice. This period of
dormancy is expected to end soon. As soon as OSCAR-10 can support Mode-B
transponder operations it will once again be released for general use.
Early reports of OSCAR-10's beacon returning to full strength can be sent
to VK5AGR @ PACSAT-1 (aka AO-16), @ UOSAT-3 (aka UO-14), @ 8J1JBS
(aka FO-20), or @ VK5WI. 73, Graham VK5AGR

OK contesters! I am in the market for a good logging program (IBM type).
What are you all using? Which ones are considered the best from a contester's viewpoint? User interface (ease of use and error correction) is a must.

Thanks.

SB RTTYDX @ ALLBBS $KT7H165
RTTY DX Notes 1of3 6/14/91

RTTY DX Notes for week ending 14th June 1991
BID: $KT7H165
Part 1 of 3.

If you have been considering a new receiver because your old one has
suddenly gone deaf, hold on for awhile, it will get better. The bands
for the past week or so have been phenomenally bad, and that's putting
it mildly. If one looks at the propagation reports (if you can find
them) you will see that the sun has been very sick, throwing up clouds
of no radio transmission activity in large doses.

It is the 'EA' RTTY contest this weekend, and we wish them luck. They
will need it with the bands in such poor condition.

Our thanks this week go to I5FLN, NT3B, OD5NG, TG9VT, UT5RP, VK2EG,
W2FG and 9X5LJ. Thank you all for your help. It sure was needed. We
hope for better things to come next week.

RTTY DX Notes 3of3 6/14/91

RTTY DX Notes for week ending 14th June 1991
BID: $KT7H167
Part 3 of 3.

Notes of Interest.

Market Reef. OH2AP/OJ0 should still be active until June 15th, though no reports have been received of their activity so far. Maybe they are having sunspot problems also.

ST0DX, Dennis, reports that he has not received his transceiver back from repair yet. Keep hoping.

W2USA is a military recreation station in the Arabian Gulf, and will be there until October. The operator is Robert, KA4SBE.

Cards from ZS9Z/ZS1 are starting to arrive, as are cards from CY9CF. We now hope for the HK0 cards to do the same thing.

Dima, UT5RP, reports that Romeo has received sample cards for the YA0RR operation, and the full supply should arrive in Moscow shortly, whereupon Dima will start sending out the cards for the RTTY operation. If you worked YA0RR on RTTY, send your cards now to the QSL address of UT5RP above. Remember this is for RTTY contacts only.

We apologize for the poor notes this week, but the sunspots were too big to treat with the normal medication.

GL DE DX1.

This bulletin is the packet edition of the RTTY DX Notes written by VK2SG, and is edited and relayed by Tad, KT7H @ N7DUO.WA.USA.NA.

445. 'We'.

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-18 09:15:02 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <18.Jun.91.10
Source record: 295871

I was always taught that in the Queen's English, the term 'we' was only used in the singular when the person being described was either a pregnant woman, or a member of the Royal family; (the Sovereign is deemed to be speaking on behalf of her/his subjects as well as expressing a personal opinion, so 'we' is quite appropriate here).

My pet hate of Old-timers is to use 'CW-ese' in phone contacts....

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 015 (OPDX.015)
June 17, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, WB3LHD, WK3N, AI8M, KQ8M, W8QWI and K8YVI for the following DX information.

PROPAGATION. Poor propagation is about the biggest thing that happened as far as DXing went. To put it bluntly, the HF bands have been the "PITS". This past week showed how bad it was. There was much lower activity then normal on the Ohio/Penn Cluster Network. There were several major flares and geomagnetic storms over the past two weeks. The Solar Flux Index for this week was between 239 on Monday to 197 on Saturday. The A index ranged between 66 to 88 most of the week, but dropped to 13 on Saturday. The K index was on or above 4 most of the week, but dropped to 1 on Saturday and began to rise again. Even though all this sounds bleak, the guys in the Ohio/Penn area were still finding interesting DX on the HF bands.

3B7, AGALEGA and ST. BRANDON. It was announced on the 14226.5 Net that a station signing 3B7CF will be active sometime during mid-July.

D2, ANGOLA. As this bulletin was being prepared, D2ACA showed up on 10 meters, Sunday, 28505 KHz at 1627Z. With the solar flux at 197, the A index at 13 and the K index at 1 there seems to be some hope for the bands. This group will be QRT June 26. QSL via LZ2DF. Rumors persist that K9AJ is the QSL manager. This is FALSE. K9AJ is only collecting contributions for the D2 DXpedition.

FJ, ST. BARTHELEMY. FJ5BL has been active on 14185 KHz at 0230Z and then he moves to 3790 KHz at 0400Z. He was also heard on 28498 KHz around 2030Z. QSL via F6AJA.

80/75 METERS. Several nights this past week the propagation on 80/75 meters was excellent to South America. There were many LU's heard and worked along with other S.A. countries.

EARLY MORNING PROPAGATION. In the early mornings (U.S.) between 1000 to 1400Z the following stations have been heard and worked regularly: 3B8GA around 14012 KHz, 4S7EA around 14009 KHz, 9M2FK around 14013 KHz, FT4WC around 14027 KHz, P29DK around 14015KHz and V63ST around 14193 KHz.

ZS9Z/ZS1 QSL CARDS. Dave, AI8M, reports receiving a ZS9Z/ZS1 QSL card via WA6AUE. The card was received in less than two weeks.

QSL CARDS IN THE MAIL. VK6BFZ/VK9X, 3W4DX, FT5XH, YA0RR (Full color foldout), RV0YF, ZL9DX and KJ4LA/HN (This QSL is an actual 5x7 photo of Desert Sheild/Storm site with a oversize computer generated QSL attach to the back. This will be a collectors item).

QSN REPORTS.
HF0POL - 3507 KHz around 0150Z. QSL via SP3HLM.
CE0ZIS - 3794 KHz around 0430Z.
XX9TDM - 14003 KHz around 1115Z.
HS0E - 14032 KHz around 1207Z. QSL via K9EL.
HS0AC - 21024 KHz around 1346Z. qsl via NY2E.

REMEMBER ARRL Field Day Next Weekend, June 22-23.

Even if your HT could reach the 60 miles, passing cars will be far more frequent than other hams and will thus be far better insurance against disasters. Desert pay phones????

You forgot to put the smiley-face on that one. People might think you're serious. While I've never heard "CQ DX" on the MARS frequencies, the idle chit-chat makes 2M FM operators look like steely-eyed communications profesionals.

WARC '79 and International law prohibits any Amateur Radio Station from transmitting
below 30 Mhz without passing a code test. I dont know the specifics, but
I would tend to think that INCLUDES MARS operators. Why would
MARS want them anyway -- have you heard some of them of VHF?

I'm interested in Amplitude modultion my transmitter,
but hate the use of AF transformers for modulation.
Recently I experienced with Class A Heising modulation,
and made a modified version of it by splitting the (one)
large choke in two smaller ones and linked them with a
large capacitor(Hi-pass PI match). This works fine but
the rendement is abnormal low (30%). So I want to know
things about puls-modulators, i.e.:

- What kind of puls-modulation should I use,
P.A(mplitude).M. or P.W(ide).M.
- At which speed should the modulator work
(for audio to 20 kHz).
- How should I configure the last stage to
couple it to the high voltage line of my transmitter

If somebody knows more about these things ,please send the
information. I will apriciate it.

Greatings from Dirk. A'dam, Holland.

Message-ID: <9106180858.aa26498@CC1.PICA.ARMY.MIL>
Source record: 295923

Hey all,

Has anyone heard the fairly loud (S7 or so on the East coast) WIDEBAND noise on the CW (you know the part of the band where they go beep-beep) portion of 20 M lately. It appears to be eminating from the Middle East and is *quite* wide. We (read: me, myself & I) can hear it from about 13.6 Mhz to 14.15 Mhz. Maybe its spread spectrum... maybe its Sadman Insane from YI land. All in all, it has severely disrupted communication at our QTH... ;^o 73 Walt - k2wk.

I didn't see anything confusing about the message at all. It says if you want to join AF MARS, you must have an HF rig. Seems easy enough to understand to me. And before all the Brown shirts start jumping up and down screaming "They don't have a license for it!!" remember, that MARS runs on MILITARY frequencies and can do anything they please.

A MARS station is NOT an amateur station! It has a MITLITARY license and
there is no code requirement. MARS provides excellent training and can
make a good operator out of almost anyone, so send them on down. K9ALD

Just to clear up any confusion: MARS (and Civil Air Patrol) radio communications are not amateur radio operations. They are governed by regulations separate from amateur radio regulations (i.e. WARC, FCC Part 97), have their own frequencies, and their own paperwork (sigh). I have a CAP Radio Operator's Permit, but not an FCC license (7 weeks and waiting), and can, in theory, transmit on certain CAP HF frequencies without ever taking a code test. Before you get too jealous however, CAP (and I presume MARS) communications are strictly business - no recreational chatting.

Impatiently waiting for my ham ticket...Joakim

P.S. For you CAP people out there: CAP personnel are eligible to participate in MARS given the right paperwork is in order. Has anyone ever done this?

459. Out-of-band xmit

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-18 17:15:36 UTC
From: aviator@athena.mit.edu
Message-ID: <1991Jun18.171536.27547@athena.mit.edu>
Source record: 295833

I hope I'm not opening too big a can of worms... Maybe I'm just being overly naive, but why is there such a big demand for out-of-band transmission mods? I can understand the quest for extended receive. I can understand certain transmit mods, for example for CAP or MARS (I modified my Kenwood TH-27A for CAP). But what is the motivation for Joe and Jane Q. Ham? Is it the feeling of power of being *able* to transmit out-of-band, but never doing it? A certain feeling of evilness? Are there legit reasons I'm not aware of? Or, are people looking for less crowded frequencies, operating on the wrong side of the law (*ghasp*)? :)

Curious and innocent...Joakim

Ah yes, 28.325 is the frequency used by the North Texas Idiots. God forbid that anyone approaches with in 10 khz of their personal frequency. These neaderthals frequenly appear during contests and other social events and derive great pleasure on causing stress and upset on the recipients of their childish outbursts. I have heard them several times and had the great pleasure of accidently calling cq on 28.325 after asking several times if the frequency was in use...I really need to control my urges to call cq during a major contest :-)

It would be nice if the FCC would shut down these idiots, but I fear they will be around for a while. One of them did give me a call once, but of course the call was bogus. I suspect they do not have more than a Tech license, otherwise they would have a great time on 14.313. But maybe this is a new chapter of the 14.313 gang!

463. GEOMAGNETIC STORM UPDATE - STORM HAS ENDED

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-18 18:10:44 UTC
From: oler@HG.ULeth.CA
Message-ID: <910618121044.27a00c93@HG.ULeth.CA>
Source record: 295858

/\

GEOMAGNETIC STORM UPDATE

ALERT CANCELLATION

/\

17:00 UT, 18 June

STORM UPDATE INFORMATION:

The minor geomagnetic storm ended early in the UT day of 18 June. Conditions have now become generally active to unsettled. Conditions will remain generally unsettled until 20 or 21 June, when recurrent effects should begin to increase geomagnetic activity once again. The peak of the activity may approach minor storm levels, but is not expected to be significant at this time.

Region 6659 passed beyond the west limb on 16 June and is now out of influential range. It continued to produce major M-class flares as it passed beyond the west limb. Although this region has not been the only region so far this solar cycle to produce very powerful X-class flares which have saturated the GOES sensors, it is the only region observed so far this solar cycle to have produced at least three of these events. It maintained a complex configuration as it departed from view on 16 June. There is a chance it may return in a configuration capable of supporting isolated major flares, although there is a stronger chance that it will decay further behind the sun and will return in a configuration capable of supporting only the lower-level minor M-class flares. It will be interesting to observe the return of this region near 01 July.

The barrage of major flares which occurred over the last two weeks has ended. The regions presently visible are not capable of supporting major flares. Isolated low-level M-class events may be observed, but major events are not expected from the regions visible at the present time. Proton levels are still above event thresholds at approximately 15 pfu at greater than 10 MeV. The satellite proton event should end later this UT day. The Polar Cap Absorption (PCA) event ended fairly early in the UT day of 18 June. Sporadic localized absorption has been observed since then over the polar regions, although overall PCA has ended. Conditions are more favorable for polar path signal propagation. Further improvements will occur over the next several days.

Solar indices are dropping at the present time, and will continue to drop towards a rotational minimum between 135 and 150 (for the 10.7 cm solar radio flux).

The following alerts and/or warnings have been CANCELLED:

- LOW LATITUDE AURORAL ACTIVITY WATCH
- POTENTIAL GEOMAGNETIC STORM WARNING
- POLAR CAP ABSORPTION EVENT ALERT
- POTENTIAL MAJOR SOLAR FLARE WARNING

The following alert remains IN PROGRESS:

- SATELLITE PROTON EVENT ALERT (will end shortly)

/\

SOLAR TERRESTRIAL BULLETIN

15 June, 1991

WWV & WWVH SCHEDULE CHANGE

/\

RADIO STATION WWV AND WWVH SCHEDULE CHANGE

For those who obtain information from radio stations WWV or WWVH, please note that the solar radio observatory responsible for measuring the 10.7 cm radio flux has been moved from the Algonquin Radio Observatory (near Ottawa, Canada) to the Dominion Radio Astrophysical Observatory (DRAO) in Penticton, British Columbia, Canada. As a result of this move, the daily 10.7 cm radio flux measurements are now taken at 20:00 UT instead of 17:00 UT as was the practice at ARO. This has shifted the schedule for updates on WWV and WWVH. The new daily data on WWV and WWVH is now provided at 21:18 UT instead of 18:18 UT. This change was adopted in early June and is now permanent.

** End of Bulletin **

465. Re: Out-of-band xmit

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-18 18:29:03 UTC

Source record: 295837

One possible justification for out-of-band transmit capability is use with a transverter-based VHF/UHF operation. For example, using 10m as the IF, and transverting to/from the 220 MHz band, weak-signal activity is now split between 220.100 and 222.100 MHz. To get both calling-frequencies +/-100 KHz, you need a 2.2 MHz wide IF band. No HF ham band is that wide. Also, depending on the stable local oscillators available, it might be much easier to use some oddball IF.

Of course, weak-signal VHF/UHF operation is statistically insignificant when looking at the US ham population as a whole. (How many times have you heard "You're 59+20dB" reported on the repeater? And how many times have you heard hams discuss transverter-based weak-signal VHF/UHF operation?) As are maritime emergencies, mid-ocean aviation emergencies, needs to loan your station to your neighbor in MARS, and many other "good reasons"....

Well, I'm sure I'll get flamed now....

The question "why people want to modify their radios to transmit outside legal ham bands?" was asked. Two legal uses for such a capability I'm aware of is:

1) to drive a transverter to operate on another legal ham band.

2) Along with use of a dummy load, or some such closed system, to generate a test signal to test receivers, such as scanners.

And there's the main reason: to operate when you are a mars or cap person.

And there is the "Emergency where someone's life is in danger, and there's no alternate means to get help other than getting on the local police radio system" reason. Far as I can figure, the FCC will not object, but the police will be very unhappy with someone getting on their internal private comm system. I suppose, if you have a close personal friend who happens to be the police chief, and you describe your radio's ability to transmit on his system, and say you won't unless it's a dire emergency, then he might say it's OK if he trusts your judgement. There was a whole big thread on this topic last year. Not again!

Date: 1991-06-18 19:46:28 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <7365@vela.acs.oakland.edu>
Source record: 295842

I just purchased a 5/8wave 2 meter mag-mount antenna at a hamfest (Monroe, MI). I was wondering why does it work so well over a 1/4wave. The antenna package said something like 3.4 dB gain (it didn't say relative to what). I though antenna have to be in multiples of one wavelength (1/4, 1/2, 1, 2, 4), but 5/8 seems kind of odd, yet it works very well.

thanks for any info,

I know this may sound too commercial for the net but I think the reason
many do it is becuase they are worth more with out-of-bands mods installed.
I know that I like having the increased rx capabilities.. but I know many
hams that make the mod just so that when they give the rig up to upgrade,
becuase they seem to get more for them that way.

To be frank I don't like running tx modded gear (in regards to frequency)
becuase when I borrow a friends HT I never know when I may have accidently
QSYed the rig (the gang I know has a fairly wide selection of HTs)

Well, I used CT in the ARRLDX contest and fell in love with it. It allows connection to the packet cluster for DX spoting (and will keep track of which spots you need) and also connects to the computer interface port of many rigs. It almost makes things too easy - a DX spot comes up on the packet window, you hit one key and your rig QSY's to that freq, you work him and hit cr. It does the rest. In the CW case it can key your rig through the serial or lpt ports with a simple interface. The new version 7 has support for about 8 different contests, as well as general logging.

Bob Headrick WA7OVU

There is a network of linked 2-meter repeaters in the Southwest. It covers an area encompassing west Texas, NM, and AZ. So, while the ham density is low, the repeater serves a reasonable number of hams and you'll have a good probability of finding someone to chat with.

The benefits of a 2m HT in an emergency is enough for me to carry one on every outing. The newer HTs are physically small and light, although they don't have much of a battery. They last long enough to hike all day if you don't transmit a lot.

The packet network (everywhere) doesn't have the reliability of the commercial links, so don't expect to be able to connect and read a BBS during your off-hours.

>I also intend to trailer it to places like Lake Powell, ...

I just got back from a week of Lake Powell HFing. What a place.

HF at Lake Powell is a no-op. Come to think of it, VHF at Lake Powell is a no-op, too. The canyons are real RF-eaters. If the boat was sinking, you'd have to paddle it into the main channel before using the radio. Either that, or string up the rhombic across the canyon rims.

As far as I know, there is no HF rig that does well in salt water, so cheaper is probably better. I know the Kenwood TS440 can be modified to transmit anywhere, the same is probably true of the 747GX.

Two marine batteries would probably work. I used a single marine battery that charged when the engine/generator was running. My duty cycle was lower than I thought, although the recent solar flares probably had something to do with that. Another guy brought a solar panel to charge the marine battery for the stereo. Boats and solar cells seem to go together.

I hesitate to mention the 14.313 net. See what they use there.

Maybe the capacitor that filters the relay coil current got knocked out
when it dropped. These things are usually heavy enough to not like this
sort of abuse. You could try feeding the relay with regulated +12 and
see if the problem goes away when then 468s are turned on.

BTW, I'd find some 2n2222s. They're cheap and it's one less thing to
try to debug.

I'm curious as to other people's experience with gain and 5/8 wavelength antennas. I used one on my HT for a couple of weeks and noticed my ear was getting warm. I switched to a 1/2 wavelength AEA Hotrod and this problem went away. I did some testing on simplex with the help of a couple of other guys and there was no noticable difference in signal strength between the 5/8 and 1/2 wave antennas, but the 1/2 wavelength antenna actually produced a cleaner audio signal. I switched back and forth several times and monitored my speaking voice and distance from the mic carefully and without a doubt the 1/2 antenna was cleaner according to the people monitoring my transmissions. We were all suprised.

The ARRL Antenna Compendum Vol. 1 has an article on 5/8 wavelength antennas and HT's and mobile use over the roof of a car are supposed to be two areas where the 5/8 antenna will not out perform a 1/2 wavelength antenna. I went with a 1/4 wave antenna for my truck based on this article, but other than my HT experience I have no other experience with the correct and incorrect usage of the 5/8 wavelength antenna.

Any comments?

I agree 100%. Using out of band modified rigs as IF stages is perfectly legitimate. In fact, based on the number of mods requests that I've seen, I'm truly amazed at the number of people that must be running SHF/EHF these days. :-)

Sarcasm aside, however, I'd like to submit that perhaps 1 ham in 20 actually seeks or uses modification for this specific purpose.

Let's be honest. I have a couple of radios which are modified for out-of-band transmit and to be perfectly forthright, I don't know why. Perhaps it's related to the forbidded fruit syndrome - it feels good knowing that you are capable of doing something that you're not supposed to do. Many folks don't need to fulfill the fantasy (e.g. actually transmit), they just like knowing that they could. It's also the same reason that some people own too many power tools. One has a feeling of power when they possess a tool which has a multitude of uses, both legitimate and illegitimate, weak and powerful.

Why are automobiles still built and sold which will go twice the normal highway speed limit? Because people don't like being told what they can and can't do. This feeling persists, irrelevant to the fact that they may always do the "right" thing anyway. Right or wrong, it is simple human nature.

>enough room to guy a tower, and besides, I don't think I could climb a 60'
>tower.
>
>Any information about what brands work, which ones to avoid, usefull techniques
>in raising them and keeping them up would be appreciated.

The three main criteria in any tower installation are safety, legality,
and functionality. Don't neglect the first two for the third. Your
installation should meet all national and local mechanical and electrical
codes. The best way to get the straight dope on towers is to get a copy
of the Rohn catalog. This volume has a wealth of engineering information
on safe tower installations.

A crankup tower is not as safe as a normal guyed tower or a well engineered
free standing tower. In most cases, even a crankup tower should be guyed
and great care should be used while raising or lowering the crankup since
the top guys will be slack and not doing their job. Don't ever climb a crankup
tower. The safety latches can fail and the telescoping sections can act
like a guillotine removing limbs or fingers on the way down.

In some local jusisdictions, fully extended towers must be located at
least their height away from any property boundary. This is not necessary
in most jurisdictions if proper engineering practices are followed. For
a guyed tower, the guy anchors should be located at least one half the
height of the tower from the base. That means for a 60 foot tower the
anchors should be at least 30 feet from the tower base.

For a 60 footer, two sets of guys or a set of top guys and a house
bracket are recommended. For a crankup, a house bracket at the top
of the fixed section or a pylon support at the top of the fixed
section is required. A set of top guys should still be used unless
the cross section of the tower is sufficient for a free standing tower.

Mechanical considerations for the tower base and guy anchor points
depend on soil mechanics of your local area. You should either design
the base for the worst case or consult a professional engineer for
the requirements of your local soils. In general, a 2 foot by 2 foot
concrete pad at least 4 feet deep will be adequate.

Electrical codes should be observed as well as mechanical codes. The
tower must be effectively grounded against lightning strikes and

precautions against contacting overhead power wiring must be taken. Towers installed in concrete are not well grounded. You should use at least three 8 foot ground rods separated from the tower base and each other by their length. Form a ground ring with at least a number 8 wire. Run a separate wire from each rod to the tower base using approved grounding clamps. Bond the shields of cables to the tower base and use gas discharge devices to protect the inner conductors. If possible, route the cables underground to your station entrance.

Erecting a tower is a potentially dangerous exercise. Consult professionals or at least study the physics of the situation carefully. Do not try to walk more than one section of the tower up. Stack the tower section by section using appropriate temporary guys, a proper gin pole, and safety equipment. Use the proper bolts! Never reuse old bolts and don't use normal hardware store bolts. Use the specific grade recommended by the tower manufacturerer and torque them to the proper spec.

Raising a tower need not be difficult or complicated if proper procedures are followed. Generally, a guyed tower is much less expensive than a crankup or free standing tower. It's generally much safer as well.

>certain transmit mods, for example for CAP or MARS (I modified my Kenwood
>TH-27A for CAP). But what is the motivation for Joe and Jane Q. Ham? Is
>it the feeling of power of being *able* to transmit out-of-band, but never
>doing it? A certain feeling of evilness? Are there legit reasons I'm not
>aware of? Or, are people looking for less crowded frequencies, operating
>on the wrong side of the law (*ghasp*)? :)

Legitimate reasons:

1. To widen the coverage of a transmitter that will be driving a
transverter to be used on a higher and wider ham band. For
example HF rigs are often modified to cover 28-30, 28-32, 26-30,
or even 20-30 MHz, so that they allow full coverage of the
targeted VHF band such as 50-54, 144-148, 220-225, and 430-440.
Some UHF and many/most microwave transvers use a VHF input such
as 2 meters. Thus a mod to cover 140-170 MHz is really giving
you coverage of 420-450 MHz or 902-928 MHz, or much of 1240-1300.

2. Even though Japan and Europe are restricted to 430-440 MHz or less
for their 70cm, the Japanese ship most USA model radios with coverage
of 440-450 MHz, or 438-450 MHz. A couple cover 430-450 Mhz. Mods
are made to these radios to cover the rest of the ham band. All of
these mods (as far as I know) also give you coverage out of the ham
band when you do this becaue the way the radio is designed, you have
to choose one of the national allocations of the world (and they seem
to think USA is just 440-450 MHz) or else fully open coverage.

3. As a signal source for non-radiated applications and testing.

4. MARS, CAP, military and other use where FCC type-acceptance rules
do not or may not apply.

Controversial reasons:

5. Emergency use. You "can" contact police, fire, and other emergency
services in a pinch if this mod is in place. Be prepared to catch
HELL if you try this. You should read up on the applicable rules and
laws before making or using a mod this way (or any other radio even
if it might happen to be legal under type-acceptance rules).

Illegal reasons:

6. Actual use in land mobile service. Amateur equipment so modified is
often cheaper, or has more flexibility, that conventional equipment
that meets FCC rules regarding type-acceptance. The equipment may or
may not be able to meet the technical requirements to qualify for
such type-acceptance.

7. Private communications via obscure frequencies no one seems to be using.

8. Pirate broadcasting. This use is probably rare, but many an amateur
HF rig would do well to get a pirate broadcaster started in shortwave.

9. For various nasty uses such as excess power on CB, access to "freeband",
as well as jamming, playing siren tapes, and other nasty things done by
people with serious mental problems.

I have been reading a lot about NVIS lately. It's really amazing how
one can generate so much excitement about a very ordinary idea simply
by giving it a jazzy name. Hams have been using low dipoles on 160,
80 and 40 meters to achieve local coverage for many years. The 80
meter traffic net people have always known that for local communications,
you don't want to get your antenna too high. This is for 2 reasons:
1) An antenna 1/2 wave high has a (theoretical) null in the straight-up
direction, so the closer the two stations are to each other (i.e. the
higher the take-off angle), the weaker the signal. 2) High antennas
favor low-angle reception which increases the QRM from distant stations.

I'm pretty sure that's all there is to it.

I guess the VHF repeater gang has never heard of these things, so
spreading the word through snazzy acronyms is all to the good!

>overly naive, but why is there such a big demand for out-of-band transmission
>mods?

It may be that in many cases the out-of-band transmit capability is a
byproduct of obtaining some other capability. For example, the easiest
way to modify my Drake TR-7 (HF transceiver) to allow transmitting on the
new WARC ham bands was just to cut the transmit inhibit line. A byproduct
of this mod is that I could now transmit on 27 MHz CB, 12.xxx MHz Radio
Moscow frequency, or the local AM BC station on 1550 kHz!

Many people like to "open up" their 2 meter rigs so they can receive on
the public service frequencies, but oftentimes this enables transmit
there also.

Why should a prohibition concerning amateur radio apply to MARS? Or
were you not aware that MARS stations are NOT necessarily the same thing
as amateur radio stations? Maybe you don't know that you do NOT need to
be an amateur radio operator to operate a MARS station? There are many
MARS operators who have not passed a code test of any kind, and this has
been true far longer than the no-code amateur license has been around.

>me that it ought to be possible to do "cloudbounce" in one of the
>higher (GHz) amateur bands. Does anybody know if this would work, or
>if people in fact do this sort of thing?

It is not possible to "cloudbounce" under normal circumstances.
The reflection on water is due to the aprubt change in dielectric
constant from air to water and the shallow angle of incidence.
This can also be demonstrated with light. Stand at the edge of
a lake, ocean, etc. and observe the setting sun...
Now, clouds, despite carrying a lot of water have a lot of air
"mixed" in. This causes the incident wave to be diffused
and consequently attenuated when it hits the water "particles"
in the cloud.
This means it is probably possible to "cloudbounce" if
you blast enough energy into the cloud (RADAR returns on clouds).

Hope this helps and that I have got my facts right.

Looks like you forgot the smiley face, too. While I don't deny that some of our affiliate-run nets can get pretty ragged (especially on VHF), the majority of HF nets with active-duty military NCS's will tolerate little of those kind of shenanigans...Big Brother is indeed watching.

If your requirement is for capacitors in PA matching networks, then why not simply use the standard trimmer types, and adjust for the appropriate value. This is the most widely used method anyway, since device parameters may vary significantly from one transistor to another, and you are allowing some flexibility in the construction. It can be surprising just how far empirically determined values can be from those you've carefully calculated. Don't forget also that your circuit layout will introduce various stray reactances into the system, and your matching must take these into account.

If you can vary the inductor values also it will help. With air-wound coils this is obviously a simple task when tuning the circuit for required performance; with toroidal types the method of pushing the turns together/apart alters the inductance sufficiently to determine the appropriate value.

At 2m, most variable capacitors 'look' reasonable, and you'll see plenty of examples of the 'Arco' range mentoned in the Motorola RF Device Data book, so it would appear that these are widely available in the US.

If precise matching is not required, then the chip types mentioned by Jon Bloom would certainly be suitable.

I hope some of the above helps, and good luck with the project,

Simon G0GWA.

You can make a very nice local (300 miles) vertical radiating
antenna from 300 ohm twin lead. Short the twin lead together
at each end and cut into one wire at the center for the feed.
For 40 meters, put it about SIX feet above ground. It helps
if you add some wire or metal underneath for a better
"reflector". THe feed point impedance will be 50 ohms with
this arrangement. A 1:1 balun helps but is not essential. I
used this antenna on the flat roof (artificial 3 wire ground)
of a building for years on MARS to generate consistantly one
of the strongest signals in the surrounding states that was
far less effected by fading than normal dipoles. K9ALD

>kind of odd, yet it works very well.

>thanks for any info,
Quarter wavelengths (1/4, 3/4,) are used to get a current (low
impedance) feed point to match coax directly (more or less).
However, a 5/8 vertical gives the LOWEST radiation angle, thus
concentrating the power more towards the horizon than the sky
which gives it more effective gain. However, it is not a
convienient feed impedance and thus requires a matching network
of some sort.

Transverters are Hard to find maybe, but obsolete? I don't think so.
First, they let you get many bands out of one radio. Second, they
just work better. You get much less loss from the same feedline if
you run a 30 mhz (or 2 meter) signal down the tower then you do trying
to run a multi-ghz signal the whole way.

On the shady side, ham HT's are popular with police departments
because they give more flexibility for programming channels than type
accepted units. That helps a lot when you are trying to catch "bad
guys" with scanners. In the cases I have heard of, they were just
used by the vice people, not for general police communication.

You also get a lot of info requests from hams who are also volunteer firemen,
or whatever, and only want to buy/carry one radio.

The rules define 'emergency' and then say 'may use any means at his
disposal' or something close. You should learn as much as you can
to keep from being misunderstood, but if it comes down to saving a
life, it might be too late to install that mod.

This was all thought out back in 1934 when most of the transmitters
were in the hands of people with average-or-above intelligence.

499. Nicad battery "tester"(?) wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-19 18:12:33 UTC
From: washer@sequent.com
Message-ID: <1991Jun19.181233.12893@sequent.com>
Source record: 295864
Cross-posted to: sci.electronics,rec.radio.amateur.misc

With all the discussion about nicads, nicad capacities, nicad memory, nicad charging techniques, nicad ......, I thought it might be nice to build a device that would give me some quantitative measure of a batteries capacity.

I thought that building a circuit that would draw some fixed current, until the battery voltage dropped to some pre-selected value would suffice. An lm317 would work well to set up the constant current, with a little thought I (might)could develop the auto shutoff to avoid over-draining the battery and the timer circuit to record how long it held the voltage up.

Does this sound like a reasonable idea? My plan is to 'test' new batteries when I purchase them, and then periodically test to see that they have not gone sour.

Is drawing a constant current a reasonable test for a nicad? How much current?

Comments? Flames? Circuits?

I am thinking about building some microwave components for 10 GHz experimentation and would like some guidance regarding some of the mechanical constructions.

The first thing I will be doing is building a sliding short for a Gunn cavity oscillator. How much of an advantage does a choke type slug have over a flat sliding plug (fractions of dB probably don't matter to me but 1-2 dB would be significant)?

In a choke arrangement, the slot is 1/2 guide wavelength deep to the short. Is this the wavelength of the outer waveguide itself, or the guide formed by the slot (beyond cutoff anyway, right?) ?

The choke section repeats the short circuit at the bottom of the slot back to the edge of the face of the plunger. Should I try to engineer the slot (or is it even possible?) so the point where the plug actually touches the wall of the guide is 1/4 wave up and an open circuit? (The point indicated by ^A in the drawing.)

Please excuse the following crude drawing:

```
.------------------------------------------------------ <-- waveguide wall
. *************************\
. ***************** * \
. * * * \
. * * * *
. * ***** * the outside
. * * world
. * *
. * plunger (Brass, *
. * silver plated) *
. * ***** *
. * * ^ * *
. * * | * /
. ***************** | * /
. <-- 1/2 wave -----| *************************/
.------------------------------------------------------
. ^A- the sliding fit.
```

In looking at standard X-band choke flanges, the actual length of the choke section is largest at the middle of the wide face and is different at other locations because of the circular shape. Is the actual length of the choke slot critical or is there some other consideration? (Something like maximum "shorting" effect at the center of the E plane where the field is highest, and tapering off to the edges where it is less critical?)

501. Microwave Questions: Gunn device Mounting

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-19 19:44:46 UTC
From: U009@cs.cciw.CA
Message-ID: <5B0613102C1E002D-MTACY830*U009@cs.cciw.ca>
Source record: 295869

More questions about waveguide constructions.

The item I am working on is a Gunn oscillator. What is the impedance of a Gunn device mounted in a waveguide cavity. The optimum power transfer should occur when source and load impedances match, so what I am looking for is an idea about the position of the diode(?) relative to the center line of the cavity. (Aside: how does the characteristic impedance vary within a waveguide? low-high Z, centre-wall?)

Most of the motion detectors I have place the Gunn device on the center line, but the MA-Com varactor tuned sources have the Gunn and the varactor equally on opposite sides of the centre. Is there much difference?

How close together should the varactor and the Gunn be, or does it really matter as long as the varactor can tune the cavity? Would it be better to place the varactor between the Gunn and the iris to better affect the cavity length, or does it matter?

Next, the Gunn element is supposed to be bypassed to prevent parasitics at the operating frequency. Most units seem to have a .01 across the Gunn but they also have a mechanical construction which contains a capacitive disk really close to the diode. Would a simple sandwich plate capacitor right on the outside of the waveguide be sufficient, or is a larger value, like the .01, required?

Thanks in advance for your help.

Source record: 295868

Does anyone know of an older series of 2M HT, that could possibly
be found on the used market, that would have AM receive capability
on the aircraft frequencies?

A friend of mine is a Confererate Air Force `Colonel', and he spends
a fair amount of his weekend time helping to manage airshows. He's
recently passed his Technician license, and thinks that a 2M ham rig,
with receive-only aircraft band capability, would be a great asset.
He'd like to try and find an HT that isn't too big-and-heavy. A recent
weekend, with a `brick' of an HT on his hip, convinced him that size/
weight are important considerations.

Thanks,

Paul WB5AGF

And I thought that this was an amateur radio project...

Excerpted from the DevelopNet News

+=+=+=

the satellite's memory and similarly downloads or retrieves messages or other computer files. The satellite will then "store and forward" the new messages or files from the ground station to their destination which can be anywhere in the world. Depending upon the location of the source and destination stations, a message can be sent, unloaded at its destination a maximum of 12 hours later, and the answer sent back to the originating station all within 24 hours.

The ground stations receive and transmit "packets" of digitized computer information as radio waves. Packet radio stations may be powered by batteries or solar cells. Thus, they have great potential applications in remote areas in developing countries where conventional grid power and telephones are unavailable. When packet radio is linked to such a low-earth-orbit satellite as the one used by VITA, it becomes a ground station for global communications. An entire station costs between $4,000 and $6,000: relatively cheap, especially considering that computers and radios can be used for other purposes when not linked to the satellite.

VITA's use of the satellite is at the prototype stage; networks of operational satellites and ground stations will eventually be used by disaster relief and development organizations where rapid, accurate communications are required.

A dozen nongovernmental organizations, universities, and multilateral development agencies around the world plan to use the present satellite with their own ground stations in cooperation with VITA. The first installations are planned for early summer. VITA's satellite communications specialist, Eric Rosenberg, will travel to Freetown, Sierra Leone, to install a ground station for Foster Parents Plan International and provide instruction in its use. Other likely places for ground stations this summer include Djibouti and Pakistan, where there are sponsoring organizations affiliated with VITA. It is expected that 18 to 24 stations will be installed in the demonstration network by the end of the year. VITA already operates a ground station at its headquarters in Arlington, Virginia.

The PACSAT Communications Experiment (PCE), part of VITA's VITASAT communications program, is carried by the UoSAT-3 satellite built and operated by the University of Surrey (U.K.). PCE was developed and designed with funds provided to VITA by the Margaret W. and Herbert Hoover, Jr. Foundation and the U.S. Department of Energy. Persons interested in setting up ground stations are invited to contact Gary Gariott at VITA.

Source record: 295872

This discussion of the reasons for out-of-band mods leaves me scratching my head in disbelief! Some of the reasons hertofore cited would leave a babe-in-arms a cynic! C'mon, people! Credit us with a brain and the ability to use it sometimes! As far as I can see, the only valid reasons for out-of-band xmit mods are (1) in order to do MARS communication; (2) in order to cover ham bands in countries other than the United States; (3) in order to drive a transverter and (4) in order to get greater receive-coverage in a particular unit which cannot be accomplished without at the same time broadening the transmit-coverage. Just **maybe** justification could be found for emergency communications (though this, in my opinion, is extremely rare). But how many hams -- really -- spend their idle hours driving transverters with HTs? As I say, this whole thread leaves me scratching my (nearly-bald) cranium. I would surmise it also puzzles the fellow who started all this with his question.
Ah, the wonders of the world!

>not sure if you cut a 1/2 wave on 80m or 40m, or just have two antennas
>out there).
>
>Gerald J. Walsh

I have a 40 meter loop at about 30 feet. I'm located on the east slope of the Rockies. Anyone in the Rockies interested in trying a sked ? I've worked 100 watt Nebraska stations at S9+20. Maybe this is the mechanism - I'll have to check the log and see what kind of antenna they were using.

I assume the idea is to have a horizontal dipole near enough to the ground so that all the RF goes straight up. Some of the RF then bounces back down. Both stations would need similar antennas, since the conventional wisdom is to shoot your RF at the horizon. NVIS and DX antennas probably wouldn't hear each other.

One answer has not been forwarded for why out of band mods are made, and to
me it seems the most clear reason...

The HACK value. Plainly, simply, it is a hack to modify a radio to do what
you 'cannot' do. And I mean the earlier, glorious definition of HACK, not
the more 'modern' and woefully derogatory definition (which is better served
by terms such as 'vandal' 'criminal' and 'fool')

Anyways, those who are HACKERS will understand what I mean, those who
do not, won't.

I'll _never_ xmit out of band, heck I won't even xmit at all, though I've
had HAM transcievers for 4 years.. I don't have my license yet, I've been
waiting for the no-code (and I passed my exam 4 weeks ago!) ticket. BUT,
I'm eagerly looking forward to the arrival of my diodes for my IC-W2A
out of band Xmit mods...

514. 1/4-wave vs 5/8 wave antennas

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-20 09:23:49 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <20.Jun.91.10
Source record: 295818

Steven D. Kuo N8OPH asks:-

>I just purchased a 5/8wave 2 meter mag-mount antenna at a hamfest
>(Monroe, MI). I was wondering why does it work so well over a
>1/4wave. The antenna package said something like 3.4 dB gain
>(it didn't say relative to what). I though antenna have to be
>in multiples of one wavelength (1/4, 1/2, 1, 2, 4), but 5/8 seems
>kind of odd, yet it works very well.

Basically a 5/8 wave gives 'apparent gain' by modifying the polar diagram.
A 1/4-wave antenna (mounted over a theoretically infinite groundplane) gives
a polar diagram shaped like a section through a donut. (Imagine threading
a donut over your antenna, then taking a vertical slice along the plane of
the antenna, and looking at it from the side).
So a fair amount of the power goes up at angles like 45 degrees - this is
power wasted unless you are trying to communicate with airplanes.
The 5/8 wave achieves 'apparent gain' by squashing the donut and causing
the power to be radiated in a more horizontal plane.
The directionality can me made even greater by coupling multiple 1/2-wave
or 5/8 wave elements together in the right phase relationship (collinear
antennas).
NOTE that these antennas do not actually provide power gain - only a
power-amplifier can do this! What 'gain antennas' do is simply to
preferentially focus the energy in one direction at the expense of others.
The tricky thing is matching the feed impedance of gain antennas; a 1/4-wave
over an infinite groundplane has an end-impedance of 37.5 ohms; a 1/2 wave
has end-impedance of 500 to 5000 ohms (depends on length/diameter ratio
of the element). By adding a 1/2-wave plus a 1/8-wave and arriving at the
5/8-wave, its easier to get an efficient match (and hence good power transfer
from feeder to antenna) amongst other things.
I have played with 1/2-wave endfed antennas at 2 meters; building low-loss
impedance transformers that cope with a 100:1 ratio, making them resistant
to weather, AND small/unobtrusive enough for mobile mounting, is not easy!

Don't be surprised. There are lots of mysterious things in radio
communication.

In my opinion the shorter antenna you have, the cleaner audio response you
get, especially on FM. I usually get 59+20 dB reports on our repeater with
a handie and a rubber ducky, whereas when I last week tried one of those
wonderful Japanese triple 5/8 antennas my audio was weak, dark and badly
distorted.

10-4, good buddy!

Just a short statement:
Because you might want to travel. When I once travelled to the US I had to select the HT. In Germany 2m is 144-146 MHz. Repeaters transmit 600 kHz UP the receiving frequency.
So when I bought a HT I tried 12 from a brand and found one covering 144-148.995. Guess what HT I bought...

[mean-spirited drivel attempting to demean Technician Class hams delted.]

There seems to be an attempt by the above idiot and the "old Fartzies"
to start a hate campaign against hams who hold a new Technician ticket.
These are the same dim bulbs who can't seem to grasp that seniority
(senility?) is not the same as superiority. That is, just because
you've parked your butt on top of a folded-up license longer than
someone else doesn't mean you know squat nor does it give you ownership
of amateur radio. The FCC granted your license just as they've granted
the Technician's license. Techs have as much right to operate and are
deserving of the same respect accorded any ham. If you have a problem
with that, you are the one who is out of step. If the new Technicians
become a problem, it will be because they react to idiots who hate them
just for existing.

This is less of a mod than it is a function. To expand the receiver
frequency range of the new Icom IC-W2A to 118.00-170.00, 322.00-513.00,
and 800.000-970.000, do the following:

o Hold down the Light, B, and # keys while turning the power on.

That's actually a four button sequence, since power on is controlled
by a keypad button.

Internet: ...ubbs-nh!wa1omm!paul CIS: 70411,626 PLink: UPPERCRUST

Modification Instructions for the IC-W2A Handheld

Two mods, one for Cross Band Repeat and one for extended TX range

Cross Band Repeat Function

To access the cross-band repeat function, first perform the extended receive mod by holding down the Light/B/# keys while turning on the power.

To enable cross-band repeat, set each band to the frequency and mode desired. Set the current band to VHF.

Press (Function-2) (Function-Enter) and the little "L" indicator will flash. The radio is now in the cross-band repeat mode. Do disable, press (Function-Enter) again.

Extended Transmit Mod

Call the ICOM parts department ((206) 454-8155) and order a pair of MA133 diodes (P/N 1790000850). These are the three terminal surface mount diode packages. It is probably not advisable to substitute conventional leaded glass diodes here due to size restraints.

The modification involves removing one surface mount component and installing two others. The working parts are extremely small and the mod should not be performed unless you are comfortable with working while using a loop eyepiece or other magnifying device. This is a "surgical" operation. Take all the usual precautions with respect to static electricity, etc.

Remove 5 screws holding back on, and two screws on side of case below the PTT switch. Gently pry the unit apart.

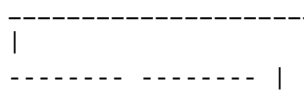
Inside the unit are two RF "stack" units. The complete RF "stack" is composed of two enclosed sheet metal boxes sandwiched together, about 1.5" wide, 2" tall and .5" thick. Each RF stack unit (one per band) is totally self contained, is about .25" thick, and plugs into the "motherboard" using connectors mounted on one end.

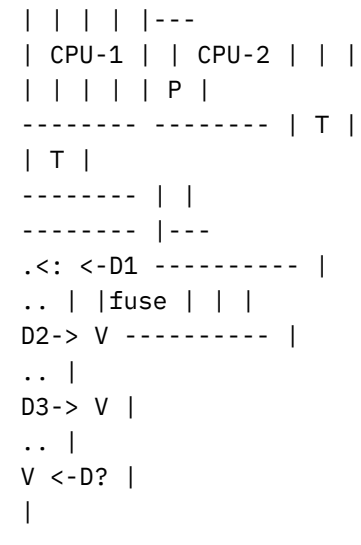
First, remove the stack units. To do this, remove one screw from each side of the stack. Remove the single screw off the bottom end of the stack and gently remove the metal spring clip holding the stack together.

Carefully lift each stack unit out by pulling it back and down. They should easily unplug from the upper motherboard. Set them aside for now.

At this time the back side of the front panel is clearly accessible and the two CPU's are visible side-by-side across the top. Now refer to the following illustration:

Top of Radio, Back side of Front Panel





D1, D2 and D3 are locations on the board. Only D2 is installed
at the factory. To perform the mod, you must do the following:

Remove D2
Install D1
Install D3

The locations of D1 and D3 are clearly silk screened onto the circuit
board and are easy to locate. Don't attempt to re-use D2. The periods
(..) show the approximate location of the solder pads for the 2-legged
sides of the diodes.

Diode D2 may be removed by carefully heating the leads and prying it up
using a sharp tool. Be very careful since it's easy to lift the solder
pads.

One method of installing diodes D1 and D3 is to use a very small drop
of super glue to mount the part, and then use a soldering iron to tack
down the pins.

After the parts are installed, reassemble the radio. Although the
manufacturer recommends that the microprocessor be reset after this
mod, I have found it to be unnecessary. All memories retained their
settings after the mod. Tests using a dummy load and a frequency
counter showed TX ability on UHF from under 400MHz to over 490MHz.
TX on VHF covers from 136MHz to 174MHz.

--
| Fred Lloyd AA7BQ Fred.Lloyd@West.sun.com |
| Sun Microsystems, Inc. ...sun!flloyd |
| Phoenix, AZ (reality -- what a concept!) (602) 275-4242 |

Now for the added part - multi-digit entry for mhz

After doing the above, REQUIRED!!

select the VHF band as MAIN
push F (above the PTT button) and SET (the 8 button)
then using the ^/SCAN button make the lower right symbol of the band say PL
rotate the right knob to set the display to 1,10, or 100 as desired
1 sets entry to single digits only
10 sets entry to 10's and single digits
100 sets entry to all digits

hit PTT

Now - repeat the above for the UHF band - Note It WILL NOT work unless you do it for BOTH bands.

You now have a walkie that requires all the digits (assuming you chose 100) to program it's frequencies.

>in particular...?

>Thanks, Mike WB2TBQ hatzakis@eva.Stanford.EDU

Yes this is a common problem. Kenwood has two pages of fixes for this problem. The first couple are easy, adding some capacitors. However, the main problem is some diodes that go south. I don't recommend most people trying the 'dig into the guts" fixes. Eventually you will have to do that. Send it to Kenwood. It costs me about $80 for them to fix everything. K9ALD

All horizontal dipoles radiate some energy at almost all angles. I used
an antenna on 40 meter MARS frequencies specifically designed (see
previous post) to pump most of the energy straight up. Even though
most other stations used standard dipoles, there was a definite increase
in signal strength on both ends, and much more consistant signals when
fading would normally wipe out communications during the daylight hours.

It seems that transmitting is a no-no, but your car can be as
reflective as you want. What about a nice pretty hub-cap design
that incorporates (very reflective) dipoles of the correct length?
It seems to me that since most of the wheel is either moving twice
as fast as your car or not at all (the part near the ground) that
the radar gun would get a confused reflection.
--
Is there any limit on passive reflectors? What about reflectors that
are active in the sense that they contain some electronics or power, but
are passive in that they do not generate any rf of their own?
--
Personally I've found that the best way to avoid tickets is to limit
my driving to states where the speed limit is reasonable (65).

>be an amateur radio operator to operate a MARS station? There are many
>MARS operators who have not passed a code test of any kind, and this has
>been true far longer than the no-code amateur license has been around.

I have received many responses like this one lately. I would like to comment
on my original posting.

1. Since MARS consists MAINLY of amateur radio operators, those operators
are required to pass a code test to operate HF on amateur bands. It should
follow that MARS operations should require an HF Amateur License (NOT
THE TECH-NO-CODE LICENSE) *** This is MY opinion, flames or not ***

2. IMHO the TECH-NO-CODE's would be a diservice to MARS operations. If MARS
is looking for heads, the admittence of TECH-NO-CODErs may fill in the gap,
but what kind of operator is it that cannot copy 'SOS' in code? Thanks,
but no thanks. (this is only my opinion)

For those of you who sent me long messages on the MARS program, thanks but
I already know a bit about it, I am a member (AFA1VB). I will be sure to
pass your messages to non-MARS affiliated CODED hams. 73 Len WF2V

One argument not given yet is this (and I personally don't think it holds a lot of water, but here goes):

In a time of national emergency (war, or possibly severe earthquake or civil unrest or something) the ham bands might be changed, or FCC regulation of the spectrum might collapse, and then it could be necessary to transmit on other frequencies for legitimate reasons.

And it would not be possible to call up the manufacturer _then_ and get the modifications, so you might as well get them now.

>Paul WB5AGF

The cheap/dirty way to receive aircraft on VHF FM radios:

Multiply the receiver's first i.f. (usually 10.7 MHz) by 2, add the aircraft frequency, tune the radio to the sum. Very strong aircraft-band signals will be received by image response, a normally-undesirable attribute of superheterodyne receivers. This method works within 1/2 mile of an air traffic control tower. Audio quality will depend upon the type of detector in the FM receiver. Most aircraft AM signals contain enough FM or phase modulation to be clearly audible; you may have to turn up the volume.

Another method of obtaining high angle of radiation is to use a reflector wire just under the low dipole. While I've never seen any detailed measurements, I know this configuration has been shown to be better than just the low dipole for close-in (<500 miles) communications on 3-8 MHz.

In ham circles, Tim Duffy K3LR and others have used this type of antenna in the Sweepstakes with great success.

>ability to use it sometimes!

What a terrible life it must be to live without illusion. To see things as they really are, without anything to cushion the pain or to hope for, what a hollow, empty way to live.

But the pity aside, hmmph. What difference does it make WHY one modifies the radio to operate out of band, as long as it is not used illegally?

Consider: ham radio has existed since early in this century, and it has only been since the advent of synthesized radios that the entire concept of a radio being restricted to certain frequencies by the manufacturer came about. Before then, we trusted hams to not crystal up their DX-60 on WWV, not to spin the VFO down to 11 meters, etc. I don't see much difference now.

So what the hell are you bitching about?
- Brian

CQ magazine had a very nice article with a circuit a few months ago. This
months issue had the circuit (labeling) correction I've been expecting. I
am planning on a modification to incorporate a meter (I like visual indi-
cators myself). Also, I'd like mine to be adjustable (for 9v packs as well
as 7.2v).

If there is enough interest, I'll post the (ascii version) circuit.
But not till after Field Day! :-)

>were all suprised.

I've noticed, and others on the net have commented on, a GREAT deal
of difference between different antennas. How well they are matched,
what the true resonant frequency is, what the relative ground plane
(in the case your h/t and your hand) is, and exactly how lossy is that
compromise antenna. Another 5/8 wave might give vastly different
results.

>The ARRL Antenna Compendum Vol. 1 has an article on 5/8 wavelength

>based on this article, but other than my HT experience I have no
>other experience with the correct and incorrect usage of the 5/8
>wavelength antenna.
>Any comments?

I'd have to go back to your reference article, but very recently I've
been reading books on vhf fm activity, specifically looking at antenna
references. The 5/8 wave antenna is a ground plane antenna (as is the
1/4 wave) and when the 5/8 is properly matched to your 50 ohm feedline
and properly tuned to the center frequency of greatest interest, should
perform quite well on the roof of a car. Mine certainly does! I built
it, matched it carefully, and pruned it to 146.000 MHz while it was in
place on the center of the roof of my car. Any 1/4 wave in the same use
would have to be as carefully installed, although the 50 ohm match does

not require a coil/cap. The BIG advantage of a 1/2 wave antenna for use ON a h/t is that it does not require an extensive ground plane! Hence you can get one that is matched for your 50 ohn BNC h/t connection and operate it with great success. Different needs for different applications result in different antenna designs!

BTW, the best antenna I've used over the METAL roof of my house is a 5/8 ground plane design. I've tried other designs (including 1/2 wave) but none resulted in the clarity and range (discounting yagis for this discussion) of the 5/8 wave!

Another note: if I were starting in on a car antenna again, I'd probably go with the 1/4 wave also. As long as you're in range of the repeaters you want to use, it is plenty of antenna, and is a LOT less obvious! For my public service work I'd slap on a mag mount 5/8 wave to get the added capture area and range for work further away from the repeaters.

freeman@watsun.cc.columbia.EDU (Mike Freeman) writes:

<As far as I can see, the only valid reasons
<for out-of-band xmit mods are (1) in order to do MARS communication;
<(2) in order to cover ham bands in countries other than the United States;
<(3) in order to drive a transverter and (4) in order to get greater
<receive-coverage in a particular unit which cannot be accomplished without
<at the same time broadening the transmit-coverage.

Sounds like another Brown Shirt to me...

The reasons all my radios will transmit "out of band".

Number one: Because I damn well wanted it that way.

Number two: Because I have occasion to need RF at VHF and UHF frequencies
other than where we're authorized to transmit. Remember that
some of us still DO experiment and build equipment.

Number three: Because I have occasion to test a receiver on a commercial
radio without the hassles of dragging out and setting up a
service monitor. If the FCC -- your opinion doesn't
matter -- considers the tramp radiation leaking out of
an HT with a dummy load antenna to be "transmitting", then
let 'em slap the 'cuffs on now.

Number four: If I ever find myself in a situation where I could save a
life by transmitting on a public service frequency, you
can damn well believe that my radio will be capable.
The overwhelming probability is that such an emergency call
would go in over cellular telephone because of its vastly
greater reliability but the ham rig is there just in case.

Amazing what hams can find to fret about. I guess that's a real problem
now that the no-code debate is over.

Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

I'm interested in building a simple antenna to improve the reception of
my DX-440. I've noticed that the FAQ posting doesn't cover antennas.
I feel that it would be a good idea to have such a file containing
the descriptions of (say) half-a-dozen easy to build antennas (including
the "random long-wire") I'm willing to put it together, if the
experienced netters would kindly send me the designs.
A review of the "popular" antennas on the market would be helpful, too.
Any takers?

Thanks in advance.

Hello,

I am cross posting a request for where I can get, or how I can build,
a TV-band tuner for a recently-acquired Video Tape Recorder (VTR).

If anyone can point me to some good schematics or companies that would
carry a tuner with signal amplifier for connection to the 'VIDEO IN'
port of the crazy VTR, I would be grateful.

Thanks in advance for any e-mail help given.

538. Active antennas

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-20 20:27:22 UTC
From: hwd@pyuxa.UUCP
Message-ID: <6@pyuxa.UUCP>
Source record: 295798
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

It appears that my previous posting on this
subject did not include a proper return
address. It's

hwd@pyuxa.bellcore.com

The question is whether anyone has had any
experience with either the Dressler AR-1500
or the Diamond 707 active antennas for the
VHF and UHF bands. I'd be interested in
hearing comments pro and con about those antennas
to help me decide on a purchase.

Thanks,

Harold

539. HF Mobile (Summary)

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-20 20:57:16 UTC
From: sumner@bigbird.csd.scarolina.edu
Message-ID: <1991Jun20.205716.14199@opusc.csd.scarolina.edu>
Source record: 295740

Recently I asked for recommendations for a good HF mobile rig.
There were about a dozen responses, and I will summarize them here in my
own words.

First, the clear winner was the ICOM 735. The comments were that it is reliable,
has a quiet front end, is generally a great radio for base station operation as
well, and has an easy to read LCD display. Also mentioned with similar
comments was the ICOM 725.

The Kenwood 440S and 140S were used by some and as radios they seemed
to get (generally) high praise. However, most people felt that the 440 is a little
too big for comfortable mobile operation, and also that the display on the
Kenwoods is hard to read in sunlight (one person also complained that some of
the buttons were not backlit and hence hard to read.). Some felt the 440 has too
many bells and whistles for convenient mobile operation.

The Yaesu 747 got some mention. It is clearly designed with mobile operation
in mind, and some people mentioned that they had used it successfully during
long trips. The main complaint seemed to be a feeling that the Yaesu is not a as
high quality rig as the ICOM and Kenwood models (of course it is a good bit
cheaper, too).

There was not consensus on the best antenna, although the most enthusiasm
was expressed for the Texas bugcatcher. Most people felt that a tuner was a
necessity, and best to use an automatic tuner.

David P. Sumner
If you ask a fish to describe its environment, the last thing it mentions is water.

540. Re: Microwave Questions: Gunn device Mounting

>to place the varactor between the Gunn and the iris to better affect the
>cavity length, or does it matter?

These questions I can't answer, but much has been written about these
matters in the professional journals (IEEE-MTT, many textbooks, etc.).
From what I've been able to learn from the RSGB VHF-UHF Handbook and other
texts at the same (hobby) level, the only truly important dimension is
the distance between the center of the Gunn diode and the iris; this
distance distance has a profound effect on the operating frequency. The
other matters (back-plate distance, off-center distance, altitude of the
diode within the cavity) are (from my limited reading and experience)
not very important, at least as far as maximum power output is concerned.
Of course, keep the back-plate a quarter-wavelength from the diode.

I wish I could recommend a text or two, but I can only suggest you find
a fairly recent book on microwave design and use references from there.

>Next, the Gunn element is supposed to be bypassed to prevent parasitics
>at the operating frequency. Most units seem to have a .01 across the
>Gunn but they also have a mechanical construction which contains a
>capacitive disk really close to the diode. Would a simple sandwich plate
>capacitor right on the outside of the waveguide be sufficient, or is
>a larger value, like the .01, required?

The disk or tantalum capacitor is there to lower the power supply
source impedance at near-audio frequencies, to ensure stability. The
diode is still a negative-resistance device at those frequencies.
To answer your question, BOTH are required.

The better designs employ a quarter-wave choke to suppress microwave leakage through the supply terminal; these are certainly preferable, especially for weak-signal work. The washer-teflon capacitor will get you on the air in a hurry. I have had good luck with both.

Cheers,
Marshall Jose WA3VPZ

>but no thanks. (this is only my opinion)

Are you saying that you wouldn't have recognized a CW SOS until you passed the CW exam!? It would be a relatively simple affair to have CW training nets if they were desired. Apparently, they need operators who can speak English! I think that many Techs would be very worthwile and effective in filling the needs of such MARS nets. My question is, would you recognize an SOS sent via AMTOR, packet, or FSTV? Does that make you a useless operator? I think not. Voice is a better all-around mode for traffic handling than CW by virtue of its speed, error-correcting digital modes are better yet (but what we really need is an automatic system; we could start by connecting the network :-). The voice operators are useful for voice, and I would expect that the occasional mayday would be more likely on voice, anyhow. Few mobile stations operate primarily CW, that I am aware of.

Maybe you should send your mayday in SSB on the 10m band, where their are lots of operators listening. I'm sure there are plently of Novices listening. Likewise, I'm sure you could get help on a 2m repeater from a no-code tech, if you needed it.

Please respect the no-code Techs for what they are and will be...trained radio operators and communicators. The MARS experience can only help, and they will not hurt MARS! I rather think they will help.

542. Quarter-wave vs 5/8 wave antennas, etc.

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-20 21:26:32 UTC
From: dube@cpdvax.CSc.ti.COM
Message-ID: <9106202126.AA05588@tilde>
Source record: 295817

Actually, the explanation for the poor modulation,bad audio, etc. from the 5/8-wave vertical antenna is due to the vertical amplifier. Over a half-wave, the top part (in this case, 1/8 wave) folds over into the radio. This vertical foldover upsets the collector impedance beyond the limit of the vertical amplifier to correct it. This in turn creates rf on the outside of the plastic case, which has been reported to cause ears and lips to burn when in close proximity to the radio. As they say in the audio business (when discussing which speakers sound the best), use the kind that does the best job for you and the heck with the specs. :)

544. MARS and the HAM

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-20 22:38:11 UTC
From: dube@cpdvax.CSc.ti.COM
Message-ID: <9106202238.AA09887@tilde>
Source record: 295820

I don't buy the argument that one should have a Ham license to operate MARS. So whether or not one is a Technician Class is irrelevant. What is needed in MARS is Disciplined Operators; and, from several postings, I gather that MARS will take care of the necessary discipline. Even though I continue to believe that ALL amateur radio operators should be able to copy Morfse code, I won't buy the notion that MARS operators must be Hams.
73,
Dube N5PDK

Sorry folks, my flame-emitter-resistance is usually pretty high, but...

In article <1991Jun20.151144.7720@lonex.radc.af.mil> popyackl@lonex.radc.af.mil (Leonard J. Popyack) writes:
>
>1. Since MARS consists MAINLY of amateur radio operators, those operators
>are required to pass a code test to operate HF on amateur bands. It should
>follow that MARS operations should require an HF Amateur License (NOT
>THE TECH-NO-CODE LICENSE) *** This is MY opinion, flames or not ***

Obviously, the various military organizations disagree with you. Fighting the military *after* they've decided on something will get you even less further than if it were the FCC. Oh, sorry, I forgot where we were - you're not fighting anybody, you're just complaining. That doesn't do anybody any good at all.

>2. IMHO the TECH-NO-CODE's would be a diservice to MARS operations.

I passed Element 1A in April. I had no expectations whatsoever of being able to do so, but obviously trying to decode novice QSO's until 4:00 am the night before did *some*thing for me. So you're saying the fact that I was able to do so *automatically* makes me a better operator? Even considering that I probably wouldn't have been there at all without the FCC action of Feb. 14?

I suppose it makes no difference that I passed elements 2, 3A, 3B and 4 at the same testing session? (I would have done 5 too, but felt sorry for the volunteers - I was already the last one there) Oh yeah, I did it on four hours of sleep, too..

>If MARS
>is looking for heads, the admittence of TECH-NO-CODErs may fill in the gap,
>but what kind of operator is it that cannot copy 'SOS' in code?

It has already been suggested that the MARS nets will teach good operating habits in very short order. So you would deny the new technicians a fast and well-disciplined means of learning good habits? What would you do instead, yell at them on the ham bands everytime they make a mistake? (Say, ever been on 14.313?) Or were you one of the folks trying to keep them above 2 meters, to keep them from EVER learning good habits?

As for copying 'SOS' (on an SSB net?), I don't see any code *requirement* for MARS. Besides, I have no doubt that MARS membership would be even tinier than it is if operators were required to exhibit code proficiency.
(I say again, *exhibit* code proficiency)

>For those of you who sent me long messages on the MARS program, thanks but
>I already know a bit about it, I am a member (AFA1VB). I will be sure to

>pass your messages to non-MARS affiliated CODED hams. 73 Len WF2V
^^^^^
What are you going to do, ask to see their CSCE for 1A? My state MARS director hasn't asked me for mine. Why don't you call him up and see how far you get proposing the idea?

I have been waiting for my license to get here (7 weeks, 5 days) so I could send in my MARS application. Air Force MARS, as a matter of fact. (Look at his email address, folks..) Fortunately, given that you're a long way from my area, I'm still going to give it a try.

>>my head in disbelief! Some of the reasons hertofore cited would leave a
>>babe-in-arms a cynic! C'mon, people! Credit us with a brain and the
>>ability to use it sometimes!

I have been following this discussion with interest as it also has relevance to the situation in Australia, but as yet no one seems to have raised the point that is the cause of the problem.

The problem is NOT the modification for out of band transmit by licenced amateurs at all. In fact, under most regulations, it is legal for an amateur to have equipment that is capable of operating out of band, as long as he/she does not actually transmit out of band. This is certainly the situation in Australia.

The problem comes from the ease of making those modifications and the ability of unqualified and unlicenced people to purchase the equipment, modify it, and use it for a pupose for which it was not intened. Someone did mention in another article the fact that most commercially made amateur gear does meet the necessary specifications for operation in the mobile or fixed services.

In Australia, this problem became such a problem that regulations were introduced to certify that amateur could not be EASILY modified for out of band transmit before it was allowed to be imported as amateur equipment.

Is this the problem that we are all talking about, or have I missed the point?

>do. Saying otherwise is insulting.

The transverter may be ordinarily used to convert for SSB and can be used
for FM. It may be easy enough to widen the bandpass well enough to get on
the FM subbands, but you'd have to change a frequency somewhere. Doing it
in the HT may be as practical as any.

>Why? Sounds like you're the sort that would mandate governors on
>automobile transmissions to keep them from going faster than 55.
>Sheesh. How about crediting US with the good sense to operate our
>equipment in a proper manner. You make the assumption that any RF
>generated by a transmitter must go to an antenna directly, and
>IT JUST ISN'T SO!!!

Such governors might well CAUSE death. I just read of one such case in
history where ther lack of it might have made the difference.

>very good SNR?

Well you could use the Grapes 56 kb modem with a crystal change on
the baudrate generator. It's an RF modem outputing on a 70 khz
channel in the 28-30 Mhz band. You use a transverter to kick it
to the frequency of interest.

One of the first tests Dale conducted with the modem was transmitting
digital voice. It worked very well from a mobile. Of course we use
them for high speed packet, but a couple of codecs instead of TNCs
and you have a digital voice link. The modem is a synchronous design
and supplies both transmit and receive clocks. It expects TTL level
data. BER for a 1 microvolt signal is around 1 in 1E6. One of the
best features of the modem is a tracking data detector that offers
no increase in bit errors for a frequency drift of plus or minus
5 khz. It will track out to plus or minus 20 khz from channel
center but will require a longer lock up time. We've found them
to be extremely reliable in packet service.

553. Yaesu FT-411E

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-21 05:44:52 UTC
From: sehrlich@helios.northeastern.edu
Message-ID: <memo.1119475@lynx.northeastern.edu>
Source record: 295822

I finally received my 411E a few days ago. The unit is really small,
and has some really nice standard features. Too bad the audio isn't
that powerful.

Anyway, I discovered something helpful with the rig, which I don't think
is published. I had some frequencies in memory, but I wanted to erase most
of them, and was too excited to bother looking up how to erase individual
memories, so I did the master reset, and the rig went back to factory settings.
Problem was, factory settings then limitted the rig to just receiving in the
2m ham bands only, no out-of-band reception. This scared me for a moment.
Then I remembered the trick about turning off the rig, and while holding
down both up/down arrow keys, turning the rig back on, and strange things
can happen. Well, this time, the rig returned to its ability to receive
out of band (which happens to be 130 - 174 Mhz). Not bad.

Just thought I'd share this with all of you.

Scott

There were reports of similar problems with the TM-231A series radios.
Alledgedly, there is a Kenwood service note out on the 231 problem which
explains the required mod to fix it. I would keep trying Kenwood
on this problem.

Source record: 295821

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
June 21 to June 30, 1991

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0

SOLAR TERRESTRIAL REVIEW FOR 31 MAY TO 20 JUNE

A magnificent barrage of very powerful solar flares is the highlight of this weeks STFR report. The first signs of significant activity were observed on 01 June. An optically uncorrelated class X12+ x-ray event was observed at 15:20 UT on 01 June. This event was accompanied by a large spray off the northeast limb. Over the next several days, Region 6659 rotated into view at a north solar latitude of 31 degrees, in the vicinity of old Region 6619.

On 04 June, Region 6659 unleashed another powerful class X12+/3B x-ray flare which saturated the GOES sensors and was associated with strong radio bursts. This event had a very high integrated x-ray flux, estimated at 3.53 joules per square meter.

The delay of several days between these powerful solar flares is evidence of a magnetic "store and release" mechanism where magnetic energy is stored until it surpasses a trigger threshold, afterwhich it suddenly and explosively releases it all. This method of energy build-up and release was observed throughout the transit of Region 6659 across the solar disk.

On 06 June, a massive solar flare ripped out of Region 6659, which again, saturated the GOES satellite sensors at a level greater than X12. This flare was optically rated a 4B event (very large in area and brilliant). This event had major Type III, IV and V sweeps with an importance 2 Type II sweep. These large solar flares produced copious quantities of high-energy solar protons which engulfed the Earth. Protons at geosynchronous altitudes passed event thresholds at 13:00 UT on 31 May and would not return back below threshold values for a stable period of time until 19 June, almost three weeks later. The peak proton flux of 1,400 pfu was observed at greater than 10 MeV on 15 June at 19:50 UT.

The intensity of the solar flaring as was observed from Region 6659 is only rarely seen. Great Flares (as they are called) have saturated the GOES x-ray sensors before (for example, during the flare storm period of March 1989). However, never before in this solar cycle have the GOES x-ray sensors been saturated so many times in such a short period of time. Even the region which spawned the large flares in 1989 could not match the stability and

power unleashed by Region 6659.

Region 6659 rotated beyond the west limb and out of view on 16/17 June. By that time, it was showing signs of decay and penumbral fragmentation, but was still able to produce another major M-class flare before it finally departed from view. This region is not expected to return in a configuration capable of producing powerful major flares, although occassional M-class flaring will be a possibility. It is due to return back into view on 01 June.

A severe geomagnetic storm was observed on 05 June. The activity began on 04 June at approximately 16:00 UT. Minor storming was observed until near 06:00 UT on 05 June, when major to severe geomagnetic storming began to be observed over all latitudes. This event produced planetary magnetic A-indices higher than anything observed since the very severe geomagnetic storm of March 1989. The planetary A-index for 05 June was 150 (compared to 246 for 13 March 1989). K-indices between 6 and 9 were consistently observed throughout the UT day of 05 June. Minor to major geomagnetic storming was the dominant feature over the last two weeks. Minor to severe storming occurred from 04 to 07 June, 09 to 13 June, and the last minor geomagnetic storm was observed on 17 June. Conditions since then have been generally unsettled to active.

A major auroral storm accompanied the severe geomagnetic storm of 05 June. Auroral activity was observed as far south as Kansas, New Mexico, California and other low latitude states in the U.S.. Many confirmed sightings of aurorae were also received from Australia. There has even been an unconfirmed report of visible auroral activity from Mexico. Repeated observations of auroral activity were observed throughout the previous two week period. Region 6659 was expected to produce several powerful auroral storms. However, the unfortunate timing of the interplanetary shockwaves prevented significant wide-spread auroral observations over the U.S., Australia and New Zealand. Weather conditions over Europe were not favorable for viewing auroral activity during most of the intense storm periods. The most intense periods of auroral and geomagnetic activity occurred during the daylight hours over North America after the 05 June event. By the time evening twilight had ended for observers in North America, the most intense phase of the storming had ended and auroral activity died down. For these reasons, significant auroral displays over the U.S. and Australia were not possible after the 05 June event, even though a high probability existed.

Strong HF radio impacts were observed as Region 6659 crossed the solar disk. Aside from frequent major SIDs and SWFs generated by the powerful x-ray flares from this region, significant polar cap absorption (PCA) blacked out radio paths over the polar and some high latitude regions. Persistent absorption from proton activity severely disrupted communications from, through, or near the polar regions. There were a few brief periods (between proton waves) where absorption levels abated long enough to permit sporadic and unstable communications from the polar regions. However, these conditions did not last long, for as soon as Region 6659 spawned another powerful flare, the Earth was quickly engulfed in another stream of protons which ionized the polar ionosphere sufficiently to absorb most radio signals.

Improvements began to be observed after Region 6659 rotated behind the west limb of the Sun. Between 18 and 20 June, significant ionospheric recovery took place. At the present time, conditions are normal over the low, middle and high latitude regions, with near normal conditions over the polar regions.

VHF backscatter communications were possible and were observed on 05 June, in conjunction with the severe geomagnetic storm. Repeated observations of auroral backscatter were observed with each period of major geomagnetic storming, although conditions were never as favorable as was observed during the 05 June event.

This period of major flare and significant geophysical activity was one of the most significant periods since the March 1989 activity. Although it is almost impossible to tell, there will continue to be a threat for similar unexpected outbursts of activity over the next year or two. There will also continue to be a threat for severe geomagnetic storms and impressive auroral displays for several more years. Based on the previous solar cycles and activity models, the next three to four years (until 1994 or 1995) will be statistically significant years for experiencing possible major to severe geomagnetic activity and global auroral storms.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain generally low to moderate over the next week. Old Regions 6652 and 6654 are due to return within the next 24 to 48 hours and may return in a form capable of supporting occassional low-level M-class flares. We are now very near the minimum rotational 10.7 cm radio flux values and should begin to observe increased indices over the next 24 to 72 hours (by 23 June). Several major flares may be observed during this next solar rotation. But overall, activity is expected to remain generally moderate, with only occassional low-level M-class flares.

Geomagnetic activity is expected to increase to generally active levels from 21 to 24 June as recurrent coronal holes begin to influence our near-Earth environment. There is a chance for middle and high latitude minor geomagnetic storming during this period, with a slight risk for major storm periods over the high latitude regions. Conditions should remain at generally active to minor storm levels over the middle latitudes during this period.

Northerly middle and high latitude regions should witness moderate levels of auroral activity on the evenings of 21 through 23 June. There are also expected to be brief periods of high auroral activity over the high latitude regions. However, lunar phase will progressively inhibit attempts to view auroral activity over all latitudes.

HF propagation conditions will continue at near normal levels for this time of year over the low and middle latitudes, with a possibility for some minor degradation during the peak hours of geomagnetic activity. Overall, conditions should be fair to good, with improvements occurring toward the end of June.

VHF propagation conditions are expected to be normal over all latitudes. The only possible exception will be the high latitude regions where some minor signal anomalies may be observed during the more intense periods of geomagnetic and auroral activity.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 21 JUNE

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6678	S28W18	114	0030	BXO	10	004	BETA

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "oler@hg.uleth.ca".

-Does anyone know of an older series of 2M HT, that could possibly
-be found on the used market, that would have AM receive capability
-on the aircraft frequencies?
-He'd like to try and find an HT that isn't too big-and-heavy.

I don't know about older vintage ones, but two of my friends just bought Kenwood TH77A's, and are both quite pleased. It's a dual bander (2m, 70cm) and can receive aircraft freqs. Supposedly they can be had for a reasonable price.

>I have played with 1/2-wave endfed antennas at 2 meters; building low-loss
>impedance transformers that cope with a 100:1 ratio, making them resistant
>to weather, AND small/unobtrusive enough for mobile mounting, is not easy!

> Pete Lucas PJML@UK.AC.NWL.IA G6WBJ@GB7SDN.GBR.EU PJML%IA.NWL.AC.UK@UKACRL

The simple fact is that (within reasonable sizes for mobile installations, etc.)a 5/8 wave antenna gives the "flattest" angle of radiation, and therefore the most apparent power gain. It MUST, however be used over a good ground plane or over a 1/4 wave mast section to achieve maximum performance. This is true for most other monopole antennas, but especially so for the 5/8 wave. The small coil at the base of a typical 5/8 wave antenna is a loading coil to extend the electrical length of the antenna to 3/4 wave for impedance matching purposes.

The feedline is usually tapped up on the coil a little to further improve the match.

From: CPDVAX::DUBE 21-JUN-1991 09:16:16.93
To: INFOHAMS
CC: DUBE
Subj: TS820

I recently bought a Kenwood TS-820S. The radio has, and according to its previous owner, always has had a problem with power-up. When it is turned on, there is only a low hiss in the speaker. Turning off and right back on seems to fix it, but if left off for 10 or 15 seconds, the same thing happens.

Has anyone had this problem? and if so, what was the cause?

I talked with a Kenwood rep at the recent Ham convention, and was less than impressed with the response and attitude I received. He acted as if I was there to complain rather than to ask for help (I asked exactly the same question I asked above). His solution: "while it is in that condition measure everything". OBVIOUSLY!

I'd like to avoid the shotgun approach, so if you have run into this problem before and can point me toward the offending circuitry, I'd appreciate it.

Thanks and 73,
Dube N5PDK dube@csc.ti.com

There seems to be good indication that it's easier to make the reading faster than slower but if you register 120 in traffic going 60 maybe the officer would think something was wrong and not write you a ticket.

There should be some shape tinfoil whirligig that would do this well. Maybe the right design would be the next fad. One for every car. Then we could start working on infra-red defences.

Just for the record, my objection to radar is that they are mis-used. Seems strange that the federal government issues reports saying that 70 or 80 per-cent of the drivers are ignoring the 55/65 mph speed limit. That per-centage should be able to change the law.

Well, in the U.S. we have the 'no-fault society'. The radio is responsible
for the violation not the person. Therefore, the radio must not be able
to entice some unqualified person to modify it.

I would have put a smiley there but it's really not funny.

Source record: 295732

Dube, (N5PDK) writes:

>I don't buy the argument that one should have a Ham license to operate MARS.

Dube, it really doesn't matter what you buy or don't buy. The fact is that this is a requirement set down in the rules to become a civilian member of the MARS program. "MARS" stands for MILITARY AFFILIATE Radio station. The FCC has nothing to do with it, the ARRL has nothing to do with it, your (and my) opinions have nothing to do with it, but the military has EVERYTHING to do with it! And folks, the military has NEVER been a democracy! :-) This may be overly blunt... but it's the truth.

>So whether or not one is a Technician Class is irrelevant. What is needed
>in MARS is Disciplined Operators; and, from several postings, I gather that
>MARS will take care of the necessary discipline.

I have watched this thread develop for the last few days and finally could not resist adding my perspective... which is gained from association with Navy/Marine Corps MARS since the days of Vietnam. So realize that most of my comments are directed towards Navy/Marine Corps MARS.

First... MARS is not set up or equipped to train and test operators for basic radio knowledge. In their bible of operations, one of the first sentences describes the "mission of MARS". In that description it quotes that MARS shall recognize the inherent ability of licensed Amateur Radio Operators. The "Disciplined Operator" aspect is just a given. Either you play by their rules, or you do not play... period. They ARE equipped to instill the training and discipline necessary for military style operations, and in fact they in many times go WAY overboard with that (IMHO). But they are not set up to teach you how to install and maintain a radio station. They rely on the fact that the operators have Amateur Licenses and supposedly know all that stuff from the gitgo. So MARS does not NEED disciplined operators to begin with (they can instill that), but they do need operators with basic radio ability, and they ASSUME that the Amateur License is proof of that.

>Even though I continue to believe that ALL amateur radio operators should
>be able to copy Morse code, I won't buy the notion that MARS operators must
>be Hams.

Two points.

1. The military still sees a need for CW nets to pass traffic. Right or wrong, stupid or smart... they do. They REQUIRE that civilian MARS members "eventually" become CW qualified. Believe me, knowing CW is just the FIRST STEP in passing traffic over MARS. Following that, learning THEIR procedure, plus THEIR abbreviations ("Z" codes) in a strictly controlled traffic net, is a MAJOR task! It's very unlike anything ham radio does. They used to

allow Novices in, but you had to upgrade within 6 months, or bye bye.

2. All MARS operators are NOT hams. The active duty military manned stations RARELY have all licensed ham operators, and in many cases NONE of them are ham operators. Over the last 20 years, the number of active duty military members serving at MARS stations has decreased dramatically! The people they are sticking in there now are "field radio operators" who have very little understanding of what Amateur Radio is all about.

Interestingly enough... this has led to some problems. In the past, most gear at military MARS stations was good old ham equipment. The "new breed" of military MARS operators have trouble operating this kind of gear (tuning an amp for example), so the move has been on to get "military style" gear in there. Military style gear is that which has an on/off switch, a push to talk button, a channel indicator, and a volume control. The most famous brand is Harris... but others abound.

So the point in FACT is that the military members (who have a predictable amount of discipline) can OPERATE perfectly... if they can manage to get the gear working... which is in some cases a REAL problem... so bad that they have to get others to come in and repair anything that breaks. So, in my humble opinion, requiring civilian MARS operators to be licensed Amateur Operators is a GOOD IDEA.

Now onto some more real facts about MARS.

A lot of "questionable activities" have been related to MARS over the years. For example... during Vietnam you were able to get a HAM license known as the Conditional Class by proving that you were not able to get to a testing location. Vietnam qualified. Many of the military guys associated with the program back then did just this... and a few cases of beer was enough to get the code requirement "waived" by the local ham giving the test. In fact with a few more cases of beer.. the whole test could be "waived". Get my drift? The recent "no code" license was not the first example of people with ham licenses not being "required" (sic) to know CW.

Conditional Class licensee's later were grandfathered into becoming full General Class hams, so ..... One of the previous DIRECTORS of Navy/Marine Corps MARS fell into this category.

When the big rush to pull out of Vietnam came... a lot of Collins "S" Lines were bulldozed right into the ground and struck from the inventory. About that time however.. some really BIG boxes full of Collins "S" Lines appeared on a certain "dock of the bay"... and were handed out via the "good ole boy network" to deserving operators. The MARS "equipment program" used to be a major scam for getting thousands of dollars worth of gear for NOTHING, and a lot of it was GOOD GEAR! That finally ended when some guy got nailed selling the stuff (while making a fortune). Naughty naughty.

MARS can (and does) in most cases lag current amateur technology by a LONG way. For example... AMTOR had been around for YEARS before it was ever used in general practice by Navy MARS. They assigned it to the "High Technology" net where guys "experimented with it" and made various reports

and recommendations on how to use it.

On RTTY, MARS had a requirement to always send two carriage returns, a line feed, and a LETTERS/LETTERS shift at the beginning of every new line so as to give old teletype machines that were low on oil... time to start typing a new line. This requirement made it hard to use the new "all in one" data boxes that become available since they had no provisions to do this. As a result, people were forced to use old/dated equipment to run traffic over RTTY instead of state of the art computerized gear.

Same type of thing happened with Packet. Rules had to be passed on exactly what MAXFRAME everyone would use, what FRACK setting everyone would use... what PACKET LENGTH everyone would use... regardless of the actual conditions at the time on HF... you HAVE to use those settings because that's what the rules say.

The list of stuff like this goes on and on and on. In addition, a lot of the active duty military MARS members have a VERY low opinion of Amateur Radio in general and think it is akin to "CB". In fact, the MARS station on one facility still has a valid Amateur Club station license from years long past. No one is licensed at the place, there is no club... but the MARS operators there assume that it is A-OK to operate on the ham bands... they have a license on the wall that says so right? Why not? The hand-held radios they use to work on the tower are on 146.52, and they quoted that this was THEIR assigned frequency! Interesting....

So in truth, Navy Marine Corps MARS is a very rigid structure, with no real room for experimenters or new idea people. The higher ups in the program are in many cases NOT hams and in some cases have no real respect for them. Amateurs that get involved in MARS sometimes also start to look at themselves as "better than the average ham". In short, you volunteer to be abused for the privilege of helping other people! :-) Really!

My hat is off to the civilians that operate MARS. They are all volunteers, they spend massive amounts of their own time and money to help pass messages for military members, and they perform a GREAT service. They are to be commended. However, the military side of the house is not all that great and could stand a LOT of improvement, but that is to be expected and will probably get worse BECAUSE less and less of them ARE ham operators.

It is interesting that the rules are followed more strictly on MARS than in the "real military". In the real military world, the rules are a guide, but if they get in the way of accomplishing the mission... the rules are tossed out the window (as long as safety is not compromised). I.E. There is some common sense there.... but in Navy Mars... the rules come FIRST and FOREMOST, and they OFTEN get in the way of getting the job done.

This may have sounded like a blast towards MARS, but it is really just the facts... you don't often hear them... most don't even KNOW them, but I felt it was time to sprinkle some truth into all the back-slapping.

As a final.... let me say that there are MAJOR MAJOR differences between the different types of MARS programs, i.e. Navy-Marine Corps MARS, Air Force

MARS, Army MARS. I would STRONGLY suggest that any potential applicant obtain the various operating frequencies and listen in on the different branches as they operate.. and pick the one that suits their personality the best.

565. Dualbanders (2m/70cm) What's your opinion?

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-21 17:42:09 UTC
From: droid@kerner.sf.ca.us
Message-ID: <9106211742.AA08142@snootles>
Source record: 295738

Hi gang-
I just passed my tech test and am waiting for Uncle Charlie to write my ticket. I want to get a dual bander to add to the cluster of commercial radios in my truck. Small is important since there ain't much space left after the phone, the UHF business radio, the LoBand county radio, and the scanner. I plan on adding a dual band antenna to the antenna farm on the roof.

I've looked at the Alinco DR-590T and the Yaesu FT-5200. I was miffed when I went to buy the Alinco to find out the base price doesn't include the PL deck, the DTMF system, or a duplexer. The Yaesu has PL and A dux'er.
The price quote on the yaesu is $639.00 at Reno Radio.

Send or post your opinions of the other dualbanders and of these units. I'm leaning towards the Yaesu since I use their commercial units. I'd also like to hear about handhelds.

Thanks

Use a 1/2 wavelength antenna for cases where you do not have a ground plane available, for example, window mount antennas, marine applications, and HTs. After measuring a number of antenna types on my network analyzer (we all have one of those, right?) I am sold on the 1/2 wave for increasing the range on an HT. No other antenna I measured matches as well and all others required a ground plane for best results.

By the way, I recently measured the AEA "Hotrod", the ICOM ("hotrod" style), and the MFJ-1714 "Pocket Linear". Results: the AEA resonated at 146, the ICOM (using a slightly longer rod) resonated at 144, and the MFJ (which had a rod length about 2" longer than the others) resonated at 142 MHz (!) All showed very good matches at their resonant frequencies. Those who have purchased the MFJ might want to shorten their telescoping rods by a couple inches to bring it into the 2m band. None of the antennas required a ground plane to maintain their resonance or overall performance.

I have not yet measured a 5/8 wave HT antenna, but will soon. I don't see how it could possibly work well, though. Bottom line, get the AEA hotrod.

> follow that MARS operations should require an HF Amateur License (NOT

And I will tell you again, MARS IS NOT AMATEUR. Every response I have seen to your posting has told you the same thing. You do not need an amateur HF license of ANY KIND to be a MARS operator. (Yes, the easiest way into MARS is by having an amateur license, but not the ONLY way.) It is simply ludicrous to require a CW test or to think that it should be required based on regulations applicable to a different service.

Let's examine your logic. Amateur radio consists MAINLY of licensed drivers. It should follow that Amateur radio operation should require a driver's license. Amateur radio consists MAINLY of sighted persons. It should follow that being an amateur radio operator should require an eye test. Or how about this one? Amateur radio consists MAINLY of MEN. It should follow that being an amateur requires you to be a man. (Hey! Diane! Make that call to Sweden!). In case you haven't caught it, this is a reductio ad absurdum argument. The results of applying your logic are patently absurd. It is absurd to apply the regulations for amateur radio to a military service operated on military frequencies by members of a military affiliated organization.

> THE TECH-NO-CODE LICENSE) *** This is MY opinion, flames or not ***

Your opinion does not match International Law, nor does it match the FCC regulations, nor the MARS regulations. Your opinion, as stated in your original posting, is that the same rules that apply to the amateur radio service (e.g. CW testing for HF operation) apply to MARS, and that is just not true.

As for flaming, I pointed out the fact that MARS is not AMATEUR. If you consider that a flame, well, that is your problem. You need to turn your flame detector down a notch or three.

> 2. IMHO the TECH-NO-CODE's would be a diservice to MARS operations. If MARS
> is looking for heads, the admittence of TECH-NO-CODErs may fill in the gap,
> but what kind of operator is it that cannot copy 'SOS' in code? Thanks,
> but no thanks. (this is only my opinion)

Of course, not having passed a CW test means that a person is incapable of receiving CW. Sorry, but I had passed no CW tests and operated in the MARS CW nets just fine. Your blanket insult of non-CW-tested operators is a slap at every military station on the net.

I hope you get over your no-code-phobia real soon, because they is cummin, and you ain't gunta be able to stop them. No, they is already here, and you haven't been able to stop them.

You would be worlds better off if you judged an op by HOW HE OPERATES rather than by the class of amateur license he holds, especially when the service in question requires no amateur license at all.

Source record: 295755

Out of band xmit gives you a signal generator with beefy power capabilities. Many builders use their transceiver as a piece of test equipment. One thing I've done with a wide open HF transmitter is to sweep my drive frequency into a tuned amplifier in search of parasitics. Everything is into a dummy load, so it's legal.

Source record: 295751

I use an LM317 with a 1-ohm resistor to create a 1.2 amp current limiter. It goes nonlinear around 3 volts and draws less current after that point. I've successfully done 19 (and counting) charge/discharge cycles on a set of 8 1000 ma-hr Sanyo 1000 AE cells with no apparent loss in capacity.

To measure the discharge curve, I'm using an HP3468A HP-IL multimeter, an HP82169A HP-IL to HP-IB converter, and an hp9000 series 350 internal HPIB. It's nice working for a computation/instrument company. :-) You could do it for $50K less by using a few resistors, a comparator, an AND gate, an oscillator, and a counter.

574. Re: 5/8wave Question

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-21 19:31:27 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <39910065@hpfcdc.HP.COM>
Source record: 295754

I've measured 3 dB (+/- .5 dB) gain in my mobile 5/8 over my mobile 1/4.
This is nothing compared to the 10 dB peak-to-valley I measured due to
terrain interference/multipath.

I usually have the 1/4 wave on the mobile because it doesn't hit all
the overhead objects. If I really need the gain, I rock the truck
6 feet for the best signal. If I need another 3 dB, I put on the 5/8.

I think the 5/8 groundplane has more gain because there are more
high-current regions on it that a 1/4 groundplane. Perhaps a 1/2 wave
over a groundplane begins to look like a collinear, which is also a
3 dB antenna - just guessing, tho.

Re: 1001 reasons for out-of-band xmit, and the sociology of the USA

#1
The 55 mph speed limit is a good analogy. Citizens of the US have had a deep-seated mistrust of government ever since the days of King George. I don't find it so amazing that there's a little anarchist in all of us rebelling for the sake of rebellion. If I want to keep a grizzly bear in my bedroom, that's MY business.

#2
Band stops are like training wheels - having them on your radio implies you're getting senile.

#3
WARC is considering moving 40 meters down a few hundred KHz. That should cause quite a few out-of-band mods so hams can remain in-band. :) If the bureaucrats can move one band, they can move them all. Being dependent on the whim of a bureaucrat is very un-American. With a wide-open rig, the WARC bureaucrats can play their games and I can still feed on the scraps.

>Andrew Scott Beals

Wrap a couple 2N3055s around an LM317 regulator. Check out the 1990
ARRL Handbook. If you keep the 2N3055s fairly close to the LM317, they
are thermally protected by the LM317.

>operators and communicators. The MARS experience can only help, and they will
>not hurt MARS! I rather think they will help.
>
I do not mean to speak against such pleadings for the non-code Techs.
HOWEVER, some of us are into construction, etc ... not just
"operators and communicators". BTW, I passed all written exams, and
still could not make 5 WPM at the VEC, (but could do 13-16 WPM sitting
on my couch at home!(:<)) Thanks for the support, but remember that
non-code Techs may be just as Tech-nically inclined.

Working with hams since 1974, and proud of it.

John, N0NDO - Now if I could just get 20 WPM!

SpaceNews
=========

MONDAY JUNE 24, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* UoSAT-F NEWS *
================
UoSAT-F will fly with a European remote sensing satellite and some other
microsats. Intended orbit will have a height of about 780km and a 98 degree
inclination. UoSAT-F will be called UoSAT-5/OSCAR-22 after launch.

The main mission is to provide store-and-forward communications for a group
called SatelLife who will use it for a non-profit electronic mail network for
health professionals. Initially, 5 African medical schools will use "Health-
Net" for E-mail and to receive up-to-date medical literature. When not serving
HealthNet on commercial frequencies, UO-22 will QSY to Amateur Satellite
channels sending AX.25 data at 9600 bps. Uplink is 2m and downlink is 70cm
(same as frequencies planned for UoSAT4/OSCAR-15). Stations using UO-14 will
be able to receive UO-22 with the same software and hardware. Telemetry,
status messages and files will be transmitted in the same pattern and format
as UO-14.

UO-22 will have a similar role to UO-9, UO-11 and WEBERSAT. Instead of
providing 2-way communications, it will transmit experimental data and
telemetry. UO-22 carries a CCD camera with a wide-angle lens (110 deg)
giving a broad field of view. Images will represent 1600 x 1800 km. Ground
features will be more detectable than on previous cameras (UO-9 and WO-18).
The image will be 578 x 576 pixels, giving about 2 km ground resolution. A
pixel is 8 bits, giving a black and white image with 256 grey levels. UO-22
will broadcast CCD images using the PACSAT Protocol. Two Transputers in the
camera unit will send the image to the main 80C186 On Board Computer. The OBC
will make an image file, with 256 bytes of header information and a PACSAT
File Header, which will then be sent. Interested in writing display programs?
Complete technical file details will be published soon. When UoS confirm the
camera works, they'll release a display program for PC compatibles.

FREQUENCY PLAN:

Downlink : 435.120 MHz 9600 bps FSK 1200 bps AFSK (backup) 5 W or 2 W
Uplink : 145.900 MHz 9600 bps FSK 1200 bps AFSK (backup)

The uplink will only be used by groundstations transmitting "hole lists" and requests for the PACSAT Broadcast Protocol.

Launch has been postponed until at least mid-July while Arianespace check an anomaly in the Ariane rocket's third stage and modify it. The extra time will be used to continue development and testing of flight software. UoS hope to bring UO-22 on-line rapidly, perhaps returning the first CCD images a couple of weeks after launch.

Incidentally, the French SARA satellite which has no connection with amateur radio, on same launch as UO-22, uses 145.995 MHz as a downlink!!

A couple of things that are of interest here... The angle at which
a radio wave enters the ionospnere does not necessarily have to
be the same as the exit angle. In one scenario documented in some
antenna and propagaion books, the wave enters at nearly 90 degrees
and exits at some much more horizontal angle, producing much more
distance that would be suspected if you don't take this phenomenum
into consideration.

Point #2 is that the reflected wave from the ground or counterpoise
under an antenna combines out of phase with the power flowing in
the antenna. This condition causes a reduction in antenna impedance.
As ohm's law tells you, for the same power, more current will flow
through a lower impedance. The ARRL Antenna Handbook shows a gain
of 3.5 db by going from 70 feet to 35 feet on 80 meters. Why? Well
simply because the far field of an antenna, the part that does the
work in producing a signal at the distant receiver, is produced by
the *current* flowing in the antenna, not the volage. However, this
"gain" is at the sacrifice of low-angle radiation. Even though the
antenna radiates better, the pattern drops off faster at lower
angles, and also, when you put the antenna closer to earth you
make more signal flow in the lossy ground, so this will offset
the gain realized. This is why a counterpoise or reflector is
such a good idea under a low antenna..it cuts the losses
considerably.

> Perry Scott / AA0ET

I did this with a 7812 and five 2N3055's (where would we be without them?) Using an using a design provoked by a circut I believe I saw in John Markus's Master Circut HAndbook or something like that (I know I saw it in one of his collections.) The 7812 drives a 3055, which drives the other 4 3055's, all sinked on a big heat sink. I think it's ultimate ratings are on the order of 80 Amps, although my heatsink and transformer aren't *THAT* big.

My Powersupply question: Browsing through the Handbook, I came accross the smart charger circut. ON a down battery, it'll feed something around 700ma, and taper off to a sustaining trinkle as the battery comes up. Any good ideas for a circut to run a relay when draw exceeds 700ma, so manual switching of the charger in and out of circut is never needed. (I'll just get up from the bench and walk away to do something, and not come back, and would come back to a discharged battery, pre-empting my fun next time a get a billionth of a second to myself.)

Second question; to to measure really high draw? I'd like a 0 to 200 amp meter for this. Automotive ones are a bit hokey and inaccurate.

Subject: Out of band mods.

In article <20433@rsiatl.Dixie.Com> jgd@Dixie.Com (John G. DeArmond) writes:
>The reasons all my radios will transmit "out of band".

jerry@altos.COM (Jerry Gardner)replies:
>The real reason is because it's a power trip. Just like people who insist
>on owning machine guns and teflon bullets and .44 magnums and all the other
>little "toys" that give them a feeling of power and superiority.

The real reason differs for every person. Some are very valid, some are not.
Some do it for no other reason than the fact that it can be done. A lot do
it because they can't stand having a electronic device that has hidden
features that they can not access. Appliance operators are afraid to open
the radio.. it might void the warranty. I believe that part of being a
ham is not being afraid to open and modify ANYTHING! :-)

Oh... have you ever gone to a range and shot a machine gun? If not, you
ought to try it... it's a lot of fun! I like to try anything new, and I
like to quote from personal experience instead of prejudice. But then,
I guess that means I am on a "power trip". Oh well.

I just purchased a 1.7 GHz preamp in expectation of using it to receive GOES transmissions, but I'm not sure how to power it. It (the unit is a "Time Step" preamp) has two screws in the side labled "12 volts", so I thought this was where the unit was powered, but on further inspection, it appears (?) that both screws attach to the case, and on opening the unit they seem to be mounting screws for the pc board, although you can't tell for sure without unsoldering the pc board. I assume then that the unit must be powered through the coax like tvro downconverters? If so, what is the best way to introduce this power without losing signal and hurting the receiver (icom 7000) front end? I assume I could use a radio shack DC-block to protect the receiver. Can I put a "T" in the line and introduce 12 Volts through an RF choke? I presume the choke should be in a shielded enclosure, or is there some sort of screw on (this unit uses N connectors on the antenna end, but those little ("f"?) tv connectors on the receiver end) connector with a built in choke available?
One more question. Since the preamp employs the mini uhf connector, I assume it is expecting 75 ohm cable. Will this hurt much going into the 50 ohm receiver input since the noise will be attenuated too, or should I try to match impedances? I sure got a nightmare of a pre-amp!

Thanks in advance. B.J. (N3JLQ)

This is one reason why licenses were once required for radio operators.
If you make it obvious that an emergency exists, words like 'mayday',
and the police operator refuses to respond, he/she is liable for fines,
jail, loss of licenses, etc. But I keep forgeting, Police don't have to
obey the laws :-).

590. was 5/8wave Question; now 1/2 wave questions

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-22 17:57:52 UTC
From: philb@techbook.com
Message-ID: <1991Jun22.175752.13540@techbook.com>
Source record: 295767

Ok, then how well does a 1/2 wave dipole work in comparison to a 5/8 wave? I understand that the 1/2 does not need a groundplane yet still requires a matching coil. The 5/8 on the other hand does require a groundplane and a matching coil. Which works better on, say, in the center of the rooftop of my car?

Phil, N7FWL

I don't understand.. I my feeling is that the antenna should not have any
affect at all on audio quality. The only situation I can see where it would
affect it is if one was weaker into a repeater (or whatever) than the other,
then you'd get the usual noise et all. How can this be?

There is an awful lot of this in the US in all kinds of areas:

They blame the gun when someone points it at a kid and pulls the trigger.
They blame the money when someone buys or sells drugs.
They blame the radio when someone selects a police frequency and transmits.

We are probably going to continue to have these kinds of problems until
such time as we can change the attitudes to understand that it is the
people who are making the decisions.

595. "We"

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-22 22:00:37 UTC
From: kh6gdr@uhm.ampr.ORG
Message-ID: <4344@uhm.ampr.org>
Source record: 295766

21 June 1991

Regarding "WE"

Many years ago (before many of you were born) the amateur radio license came in TWO parts. One was a STATION license which granted the callsign to the station at the indicated location - and the other was an OPERATORS license indicating the Class of use permitted. The EQUIPMENT had the callsign and the person merely had a permit to operate it.

Hams, in those days, built most of their stations - almost from scratch. Some of them even wound the transformers ! The term "WE" came into use in the Lindbergian sense, since in his book he gave equal credit to his airplane for the Atlantic flight. Those hams also felt that their equipment deserved to be included in the "bragging" about their successes.

Perhaps, with today's types of equipment and operators, it INDEED may be much more correct to say, " "IT" worked a VK station last night !"

Well, it's kind of interesting, but unless it gets more 'useful', I'll probably let it lapse. I'm _much_ more impressed by RF Design magazine, a 'free to qualified subscribers' rag [subscription inquiries (708) 647-1200] that has actual usable information...

I use a mag mount 5/8 wave with 5 watts out of my HT with excelent results. When I went up to Seattle and back that combination worked great! Except for some extreme cases up in the mountains I had no trouble hitting any of the repeaters along the way. In fact, 5 watts with a 5/8 seems to be all you need in probably 99% of all cases. Then again I don't do much traveling in the Midwest! 8-)

Considering that the way these magazines make their money is by advertisements,
and that they need to have a high ratio of readers the advertisers want to
reach and the number of issues printed and distributed, thet are primarily
interested in qualifying only persons in the business of radio, where a design
by an engineer can end up meaning hundreds to hundreds of thousands of parts
and systems purchased for production.

In short, being an amateur radio operator does not qualify you, even though
they often will send it free to nearly any one-person consulting "company".

What might be interesting, though, is if they can be convinced to at least
sell the magazine subscriptions on a cost-only basis to licensed amateurs
(who don't otherwise qualify at their business). If you look at the actual
subscription rates, they are very very high; certainly higher than real costs.

Bingo! Invent a name and you become a one-person consulting company. Sure, if someone wanted to try to get them to give hams a deal it would be nice, but it's in their interest to have higher numbers of qualified subscribers, (they attract more advertisers and can command higher rates), so they aren't likely to scrutinize prospective subscribers too closely.

The point I wanted to make was that this wasn't just another industry rag, while it does have 'articles' written by people in the RF industry, they have actual, real-life, useful information in them! ie. Not just "Our new synthesizer is a true-FM modulated PLL(*), but here's how we did it, and here's how we solved all the fiddly little details"

(*) Sound familiar people? Common wisdom is that PLL rigs can't do 9600-baud packet because PLLs can't be true-FM modulated.

RTTY DX Notes 1of3 6/21/91
RTTY DX Notes for week ending 21st June 1991
BID: KT7H172
Part 1 of 3.

One wonders how many different ways there are of accessing a mailbox?
As you can understand I use mailboxes a lot to find the DX notes, and
so far I have found 26 different ways of accessing mailboxes. Some,
you are there immediately, others go through a long tirade of telling
you all about their mother-in-law etc, (you go and have a cup of
coffee). Would it not be wonderful if there was a standard entry?
Oh, I know that your's is better than Joe's down the road, but being
logical, it would be good if there was some resemblance between all of
them. It would save a lot of time and mess-ups as well.

Our thanks this week go to I5FLN, JA5TX, OD5NG, TG9VT, VK2EG, W2FL,
WX5L and 9X5LJ. Thank all of you for your help and information. You
will notice from the following notes that the bands have not really
improved in the past week.

/EX
SB RTTYDX @ ALLBBS $KT7H174
RTTY DX Notes 3of3 6/21/91
RTTY DX Notes for week ending 21st June 1991
BID: KT7H174
Part 3 of 3.

Notes of Interest:

Market Reef (OH2AP/OJ0) does not appear to have operated any RTTY during their stay. At least no contacts have been reported.

There have been several reports of possible activity from Burma. Romeo states that he will be there shortly. Another group says that they have verbal agreement to operate, but so far have no official written permission. Wait for the smoke to clear.

DA1WA will operate from Frankenstein's Castle 2nd to 4th August using RTTY, 160 through 10 meters. QSL via bureau or direct to DJ0PU. Special QSL cards will be issued.

K5DIY is at the moment in the Persian Gulf, and is heading for Diego Garcia where he will operate as VQ9JT.

Controversy rages in the USA regarding FB8WZ. No one seems to know why. I have worked MALAKA many times, and he seems to answer all the normal questions correctly, though he does appear to have some problems with his receiver. Work first worry later.

Now Romeo disavows any agreement with Dima (UT5RP) regarding QSL cards. He states all cards should go to the Sofia address. But a note from Dima says that he has seen sample cards for the YA0RR operation and that he will handle all RTTY contacts. Gee, I wish someone would make up their minds. Accept things for what they are

chaps. Don't let your egos get in the way of your brain.

WO-18 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 173.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 22, 1991
TO ALL RADIO AMATEURS BT

WA3PSD Provides A WEBERSAT-OSCAR-18 Status Report

There has been a bit of unexpected behavior observed on WO-18 the
last week. If it continues so, it will be quite a timely development.
Rotation about the Z-axis has begun to accelerate. For a period
of months, the spin rate seemed stable at about one rotation every 21 minutes.
It clearly was not. The latest whole orbit data collection unmistakably
indicates a change to around one rotation every 10 minutes. This casts
doubt on the accuracy of what had been evolving as the most popular theory
(assymmetry in shape and moment-of-inertia of the spacecraft) to explain
why spin slowed originally. It's too soon to discard it, though.
But no matter. This is good news. ALL passes across the magnetic
equator now are yielding earth-pointing attitudes. And, perhaps not
surprisingly, we now have aboard and in memory five separate valid (non-
dark, non-washed-out, i.e., detailed) pictures. The best I've seen so far
is picture #6, which is the usual wispy clouds (store-and-forward meteor-
ology from space with imaging equipment priced less than $10,000 IS possible).
We will try to default to it as often as possible during the next few days,
but if your QTH is within a footprint including Utah, you will also be
getting the other picturess as we download 'em to see what's in 'em. We will
always try to reset picture #6 transmitting before the end of our passes
here. If you are on the East coast, picture #6 will probably be what you
see. We intend to start shooting more within a week, but we'll always

try to keep picture #6 or something interesting coming down as long as the Single-Event-Upsets (SEU) stay out of the sync fields.

And now the really good news. Again, if this rotation sustains itself, it produces a substantial increase in the probabilities that we will have a sunward pointing attitude at some point during shadowing in the upcoming eclipse on July 11th. I intend to contrain our shoot conditions during the event to large current generation from the +Y array and very low amounts from the other arrays. With essentially no rotation before, we were stuck with just hoping to be lucky enough to have +Y pointing properly during shadow traversal -- and shooting then. With this new rotation rate, there are better chances for that to happen. I expect to use a 9 through 3 mix of pictures that day with 9 constrained to shoot the sun (with only 10 secs between picture constraint waits) and 3 pics constrained to shoot the Earth with what will be lower light levels. Picture #9 will shoot with different camera iris values. We certainly know more now about the iris than we did, but we don't have much experience shooting the sun so nine different values are probably in order.
Enjoy.

73's,
Chris Williams (WA3PSD)
WO-18 Operations Manager

SB ALL @ AMSAT $ANS-173.03
NEW AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 173.03 FROM AMSAT HQ
SILVER SPRING, MD APRIL JUNE 22, 1991
TO ALL RADIO AMATEURS BT

New AO-13 Spring Schedule, AO-10 Not Presently Available

The newly announced AO-13 transponder schedule which was expected to commence 19JUN91 and will continue thru 12AUG91 is as follows:

Mode-B : MA 000 to MA 165 ! Perigee eclipses:
Mode-JL : MA 165 to MA 190 ! Minimum 6, Typical 29, Maximum 60 minutes
Mode-LS : MA 190 to MA 195 ! until end 1991.
Mode-S : MA 195 to MA 205 ! <= Mode-B transponder is OFF !!
Mode-B : MA 205 to MA 256 !
Omnis : MA 240 to MA 060 !

Please DON'T uplink to mode-B 195-205; it interferes with Mode S

Once Magnetorquing is completed the anticipated Spacecraft attitude will be:

BLON = 210 BLAT = 0

Magnetorquing should be completed by 23JUN91.

Currently, OSCAR-10 is not receiving sufficient solar panel until further notice. This period of dormancy is expected to end soon. As soon as OSCAR-10

can support Mode-B transponder operations it will once again be released for general use. Early reports of OSCAR-10's beacon returning to full strength can be sent to VK5AGR @ PACSAT-1 (aka AO-16), @ UOSAT-3 (aka UO-14), @ 8J1JBS (aka FO-20), or @ VK5WI. 73, Graham VK5AGR

>(they attract more advertisers and can command higher rates), so they aren't
>likely to scrutinize prospective subscribers too closely.

There is a trend among these kinds of magazines to authenticate that the
number of subscribers they claim to have are indeed in the industry.
There are at least two auditing agencies in the business to validate
such claims for advertisers and ad agencies. Apparently a claim of
100,000 subscribers where it is expected that 60% are legit is of no
more value to the advertiser than a claim of 60,000 with 100% legit.
Advertisers want more for their dollar, too, and are not interested
(usually) in funding the printing and distribution of copies to hams.

>The point I wanted to make was that this wasn't just another industry rag,

Well it does sound like a good magazine. I sent in several "free subscription"
cards a couple years ago, including to RF Design, and they never sent anything.
I did not make any great effort to make it appear as a consulting firm, though.

>(*) Sound familiar people? Common wisdom is that PLL rigs can't do 9600-
>baud packet because PLLs can't be true-FM modulated.

Why not? Just toggle the divide ratio value and you have FSK. Feed it from
an A/D and you have FM. Of course the PLL will have to track really well.
I'd rather do it with a direct digital synthesizer, though, especially if I
was going to be doing FM.

Its interesting to note that the editor of RF Design is an amateur radio
operator, Gary Breed, K9AY.

Probably just a coincidence. :-)

605. tr2600a help

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-24 01:50:13 UTC
From: djb@mailer.cc.fsu.edu
Message-ID: <1991Jun24.015013.24414@mailer.cc.fsu.edu>
Source record: 295681

Well, it's been 8 weeks and one day since I passed the technocode exams
but I haven't had the license come yet. In the mean time, I've purchased
a Kenwood TR2600A 2 meter HT at a nearby hamfest. I bought it from a
real honest looking guy who said, "oh darn, I must have left the manual
at home. Give me your address and I'll mail it to you." Needless
to say, no manual and the guy hasn't returned a few phone calls. I've
been playing the the rig (with the xmit lockout on, of course) and have
figured a few things out but have a bunch of questions.

I've found out how to assign frequencies to channels, and have been able
to set the xmit offsets. It has what appear to be 4 offset options. I
understand the + and - options, figure that S is for simplex but what is
the M option all about? I assume that the PRIO. CH stands for priority
channel and is checked every few min if you have the alert option set.
How do you set the priority channel? I've figured out the keypad options
for scanning up, down and between two preset limits...but what are the
BS/OS, CALL SGN, TO/CO & CODE buttons for? On the top of the unit, there
are 5 push buttons and two LED's. I understand that the REV button
reverses the offset but is this settable for an individual preset channel
or only across all 10 presets at one time? I assume that the LOW button
reduces the output power of the unit. Is this from 5 to 1 watt? I
assume that the TONE button causes subaudiable tones to be transmitted
along with the voice signal. How do you set this for an individual
preset. How do you tell it which tone frequency you want to send?
I understand that the call led comes on whenever squelch is broken. But
what is the CALL led for? will it light up when you xmit on this unit?
How is it different from the tx led? Finally there are buttons marked
DCS and C.AL/R whose meaning I haven't the faintest clue about.

The seller also told me he would send a vehicle adapter cable for the unit
which would allow it to opperate off 12vdc. Anyone got the schematic for
this cable? Thanks in advance for the help. I'm enjoying listening to
the local 2 meter traffic and trying to learn the repeater culture and
customs.

Davie Brightbill.

606. Re: was 5/8wave Question; now 1/2 wave questions

>/ col:rec.radio.amateur.misc / philb@techbook.com (Phil Biehl) / 11:57 am Jun 22, 1991 /
>
>Ok, then how well does a 1/2 wave dipole work in comparison to a 5/8 wave?
>I understand that the 1/2 does not need a groundplane yet still requires
>a matching coil. The 5/8 on the other hand does require a groundplane and a
>matching coil. Which works better on, say, in the center of the rooftop of
>my car?
>
>Phil, N7FWL
>
>--
Here's what Larsen Electronics (mfg of Larsen antennas for commercial
and amateur mobile radio) says:

Antenna Gain (relative to dipole)
------- -------------------------
1/4 wave 0 dB (assumes good ground plane)

5/8 wave 3 dB (assumes good ground plane)

1/2 wave 0 dB (without a ground plane)

1/2 wave 2.4 dB (with a ground plane)

{ end Larson data, start KB0CY editorial }

I think their numbers are right. Therefore, my analysis is

If you have a ground plane
Choose 5/8 wave for best gain (of the antennas listed)

If you don't have a ground plane (antenna is located above
non-conducting material or on an HT)
Choose 1/2 wave for best gain (of the antennas listed)

There may be other factors (like whether the car will fit in the
garage) which may affect your decision.

Bob Witte / HP Colo Springs / bobw@col.hp.com / KB0CY

"Not affiliated with Larson, but they seem to make good stuff."

607. Potential Geomagnetic Storm Warning - 24 June

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-24 02:04:35 UTC
From: oler@HG.ULeth.CA
Message-ID: <910623200435.27a018d4@HG.ULeth.CA>
Source record: 295684

/\

POTENTIAL GEOMAGNETIC STORM WARNING

02:00 UT, 24 JUNE

/\

ATTENTION:

Geomagnetic activity has intensified over the last 6 to 12 hours.
Generally active to minor storm conditions have materialized. At the present
time, activity is running just below the minor storm thresholds. A minor
geomagnetic storm may materialize if activity continues to intensify or
remains at current levels. No significant storming is expected.

Auroral activity could become generally moderate to high over the higher
latitudes during the local evening hours of 23/24 June. Periods of moderate
activity may be observed over the northerly middle latitudes. No significant
auroral storming is expected. Activity will not be visible over the lower
latitudes. Lunar phase will inhibit attempts to view activity.

HF propagation conditions are not expected to be seriously affected by
this recent intensification in geomagnetic and auroral activity. High
latitudes will suffer the most pronounced degradations of increased auroral
flutter, fading and distortion. Most middle and low latitude regions should
maintain generally good propagation conditions, with minor amounts of
increased flutter and fading over the middle latitudes during the local
evening and early morning hours of 23/24 June.

There is an increased chance for isolated VHF backscatter over the
higher latitude regions for the UT day of 24 June. At the moment, conditions
are not particularly favorable. However, if activity intensifies, localized
areas of backscatter may become possible over the higher latitudes. No
significant or widespread backscatter opportunities are anticipated. This
activity is expected to begin to subside later in the UT day of 24 June or on
25 June.

>
>Is this the problem that we are all talking about, or have I missed the point?

If my memory serves me (which it often does not), the issue came to a
head here in Australia not because of the availability of such
equipment per se, but the duty it attracted on being landed in the
country. Local manufacturers were happy with ham gear being imported
with virtually no duty, since none of them made any ham gear in Oz.
However, when modified ham rigs started appearing in big enough numbers
for them to notice, they cried foul.

Commercial gear attracts a much higher import duty due to the perceived
need to protect the local industry, and the ham in question rigs were only
attracting the concessional rate, and then being modified subsequently.

I don't think approval came into it much -- the rigs were generally used
on frequencies that the user had a licence to use, so unless somebody
screamed to DOTC (Australia's FCC, FAA and DOT all rolled into one), I
doubt they would have known that non-approved gear was being used.

A common reason put forward at the time was the use of such modified gear
as an 'emergency backup' for the primary (approved) rig, in applications
such as marine HF or the Flying Doctor services. Methinks that a lot of

these people didn't actually have a 'primary' radio at all.

It's a pity that the whole thing came to a head as it did, if I were travelling in the wilds of the Australian outback, or an ocean-going yacht, I'd certainly feel more comfortable if I could transmit on recognised emergency frequencies, even if it was technically illegal.

BTW, what is the position on hams using emergency frequencies to respond to a distress message, if it is obvious that nobody else is listening. If I were to receive a distress call on my (hypothetical) general-coverage HF transceiver, what is my legal position?

From: esf100@cck.cov.ac.uk
Message-ID: <L{2{*3}@cck.cov.ac.uk>
Source record: 295686
Cross-posted to: rec.radio.amateur.misc,soc.veterans,soc.culture.french

Hello reader,

I am due for my military service in the French Army before Feb 92.
I have volunteered for a PMS (Preparation Militaire Superieure)
starting July the 2nd in Valenciennes, near PARIS -> Valdahon camp.
At the end of this 24 days training, I will be asked for my preferences.
Knowing that I am an graduate in Electronic Engineering and Ham operator,
should I stay in Paris to transmit from the Eiffel Tower or some famous
military transmitting centres (Mont Valerien, Fort de Bicetre)
or should I volunteer to depart to Martinique or Guadeloupe Islands
in the Carribean ocean or New Caledonia in the Pacific ?
I could also help out at the National Radio Society's Headquarters
(and activate the well equipped Radio Club)...

Any thoughts will be carefully considered.

611. ALINCO DJ-F1T New 2 Meter Handheld

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-24 11:44:35 UTC
From: jay@amateur1.stratus.COM
Message-ID: <MailManager.677763875.7590.jay@amateur1>
Source record: 295687

I have had this gem for 3 weeks now and would like to share my findings. In addition to my own I will include some feedback from other hams who have put it through it's paces.

1st: The DJ-F1T is the domestic version for a 2 meter portable. It fits solidly in the palm of your hand with very little overlap. It would fit in your dress pants pocket with no trouble.

2nd: The belt clip is wide and long (length of the radio) and made of metal. Hams who have used the radio all have been very impressed.

3rd: The radio does not appear (to my surprise) to loose receive sensitivity when attached to your belt.

4th: The receiver is red hot, and you should see the 3" antenna approx.

5th: The keys on the front are light touch and it's not difficult to hit the wrong key by mistake. This is lessened by the ptt and function pad lock features.

6th: The LCD illumination is good. BY using the Func Light sequence you can keep the light on. One of the hams left the light on the display constantly to simulate emergency conditions. Usage on a 2 watt battery is about 1 Hr constant use. You will get a full day on receive.

7th: The audio is pretty good for a small handheld. It is more impressive then most. It's not a bose, but none are!

8th: With one snip of a wire, airband can be yours. Freq range would extend from roughly 108 to 173.995. The transmitter doesn't seem to fall off on the transmitting range boundries.Transmit range is 134.5 to 173.995.

9th: The battery does not attach in the conventional way, but is solid in design and works very well. Battery hinges into the top of the radio and folds down to the bottom of the radio and latches closed. There is a locking tab as well.

10th: I have found under constant use with the 2 watt battery, no overheating or warmth to the radio. There is no more heat after an hours use then the heat caused by your hand holding it.

11th: Inside the radio, you can find berilium (??) fingers for EMI strays.

This may help should you be looking for a handheld.

Regards,

Jay Appell (KA1SNA)

> affect it is if one was weaker into a repeater (or whatever) than the other,
> then you'd get the usual noise et all. How can this be?
>
> Phil, N7FWL
>

Well, I'm shooting from the hip (hope I don't shoot my foot) but I
kind of suspect that the cause is a variation of 'multi-path' for
lack of a better phrase. On VHF, a lot of things become good RF reflectors
and you can have several 'wave-fronts' arriving out of phase at your
antenna. If the antenna has a larger capture area, the chances for
this increase. I've noticed the phenomena a lot while listening to
local FM broadcast in the car... sometimes the audio gets real
sloppy, but if I move the car about 12 inches, it cleans up.
I think the 5/8 antenna would give superior performance if used
in a relatively flat area outside of the city, maybe not so good
in city under the right conditions.

73,
Tom KD9NL/7

|>license, otherwise they would have a great time on 14.313. But maybe
|>this
|>is a new chapter of the 14.313 gang!
|>Jim, WA6SDM
|>

If they don't follow any of the other rules, why would they let the class of license restrict their operating frequency? They probably chose it because it's available on inexpensive, easily available (i.e. Radio Shack) single band radios. (Sort of a "Saturday Night Special" of the ham bands...)

Hello, all.
After a number of years as an inactive 'ham', I'm getting the
urge to get back on the air. In particular, I'm interested in
packet and other 'digital' communications modes. Naturally, this
means having a computer/terminal etc running at the same time as
my transceiver - and there's the rub. All of my computer/terminal
stuff throws so much RFI garbage that my receiver is nearly useless.
I've already installed toroids on the power leads, cleaned up the
shielding and improved my grounds ... all with marginal success.

What I'm looking for now is the next level of suppression. Do conductive
spray paints work? If so, any particular brands and where can I find
them? Also, are there other possibilities (besides putting the computer
in a screen room)

Thanks for any help
73,
Tom KD9NL/7

615. Hams and MARS

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-24 14:14:29 UTC
From: dube@cpdvax.CSc.ti.COM

From: CPDVAX::DUBE 24-JUN-1991 08:53:26.80
To: INFOHAMS
CC: DUBE
Subj: HaMS AND MARS

Thanks to Mark for shedding some light on the subject. It was the most comprehensive treatment yet. However, I was a little chagrinned that my statement that I don't buy the fact that you need to be a Ham in order to be in MARS was attacked, then followed by several screens of prose that tend to support it.

I read in one of the postings that there are training nets. If MARS isn't into training, then what are these for? If military MARS members can't operate equipment more complex than "on-off, channel-select", then why must their civilian counterparts be any more technically adept? Okay, okay.. I'll accept the argument that "it's in the regs". As Mark stated, frequently "the regs" is the only thing that counts. But this still doesn't modify my opinion that one shouldn't have to be a Ham to operate MARS.

At one time I was a "trained military radio operator" (I also knew how to string phone wires through trees and set up switchboards and com centers, both wire and radio). But I never was a MARS member. For years I wasn't a Ham, but I was fully up to speed on military com, even as a civilian. I'd like to think that I could have been a MARS member and not been rejected simply because I didn't have a Ham license.

The pervasive truth of Mark's statement that "it doesn't matter what (I) think" is apparent when considered in the light of military rules and regs. I still don't buy it, Mark, but I did enjoy your article.

73,
Dube N5PDK

|> but no thanks. (this is only my opinion)
|>

A. "SOS" was dropped as an International Distress Signal a number of years ago.
B. I can't speak for the Air Force, but the Army stopped teaching Radio Operators Morse code over 10 years ago. (I know, I was one of the last Morse qualified RTT Operators (05C) and I got out that long ago. Based on their recent performance in the MIdEast, the lack of CW doesn't seem to have destroyed the integrity or the effectiveness of our military.

It seems to me that AF MARS has just decided to catch up with the present.

Somebody said:
>Another note: if I were starting in on a car antenna again, I'd probably
>go with the 1/4 wave also. As long as you're in range of the repeaters
>you want to use, it is plenty of antenna, and is a LOT less obvious! For
>my public service work I'd slap on a mag mount 5/8 wave to get the added
>capture area and range for work further away from the repeaters.

Another possibility is to use an antenna mount that accomodates both
1/4 wave and 5/8 wave (for example, Larson mounts). I leave the
1/4 wave on 99.9% of the time so getting into the garage is no problem.
Then for situations where I really care about the antenna gain, I put
the 5/8 wave on.

And when I REALLY care about gain, I've got this 11 element yagi...

High Frequency (2 MHz to 30 MHz) transmitting and receiving capability in at least one mode (CW, SSB, RTTY, AMTOR, etc.) is a requirement of ALL three services MARS organizations. The exact frequencies vary by service, but generally you need to be able to transmit/receive in the 2-3MHz, 4-4.5 MHz, 6.9MHz, 7.3MHz range(s) in order to participate in state nets sufficiently to meet minimum operating requirements (1/2 or more, depending upon service, of which must be accomplished on HF!). Later, as a gateway or phone patch station, you might need 10, 12, 13, 14, 15, 16, 19, 20, 21, and/or 27 MHz capabilities. The emphasis is on station capability - not what class station/operator license you hold in the Amateur Radio Service.

Remember that MARS operates on MILITARY frequencies - which are not regulated nor controlled by the FCC but by the DOD and coordinated through the Executive Office of the President.

Your MARS license, when you obtain one, is a STATION license. You are never licensed as an OPERATOR in MARS just as military personnel operating military equipment on military frequencies are not licensed per se. By international treaty, GOVERNMENT operations need only "certify" that operators are trained. The evidence of training for MARS affiliate members is the ham operator license prerequisite. That's why even a Novice class Amateur Radio Service operator license is sufficient for entry into MARS operations.

The international treaty requirement that hams operating in the HF spectrum possess a CW skill is applicable only to the Amateur Radio Service.

Since CW has been eliminated by all military services as a radio operator training skill, it only makes sense that a codeless technician Amateur Radio Service operator license should be acceptable into MARS - pasrticularly since it follows that many military MARS station operators do not know CW! (If in the service, you do not need a ham license to operate MARS). I trust that ARMY and NAVY/MARINE CORPS MARS will follow suit. It does not mean that MARS is abandoning CW as an actively utilized mode - CW nets are active and encouraged.

Regards, Wayne KB6CSP/AAR2ZH NYS ARMY MARS

619. Commercial/Educational TV Scam?

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-24 15:03:16 UTC
From: glenne@hpnmdla.sr.hp.com
Message-ID: <14570088@hpnmdla.sr.hp.com>
Source record: 295698

There may be a better news group in which to ask this but I bet someone
here knows the answer and it pertains to amateur operations at n6gn anyway
so I'll ask here.

Our local school board (supervising a rather small district) has
been approached by someone wishing to set up television broadcast facilities
from one of the district's two campuses. The proposition is presented
as a "marriage" of educational television with commercial wireless TV.
The idea is for the commercial concern to provide the entire transmission
facilities along with some number of satellite feeds for the schools
in the area to use under their Instructional Television Fixed Service, ISTF,
qualification. Supposedly under this umbrella the schools can lease some
number of hours of air time per day to commercial interests. The idea being
that the schools get to use whatever educational programs they can find
during the day and the commercial concern takes over and competes with
the cable TV industry at night...more or less.

The school is to get monetary return in addition to setup and maintenance
of the facilities. It almost appears a "something for nothing" deal for them.

The "technical" information that came with the proposal is extremely
sketchy. It implies 10-100 watts (ERP?) and a 200' tower. No frequency
is mentioned but I suspect this is in the 2 GHz region. The estimates
of signal quality and potential viewership are not well documented and
I believe fundamentally flawed, giving an inflated impression of the
coverage and quality. My own estimates and experience indicate that only
a fraction of the number of viewers suggested would be able to receive
quality video.

The school property being considered for this is adjacent to and shares
a property line with N6GN. Needless to say, I am concerned about the
prospect of TV synch lines effectively curtailing weak signal operation at
n6gn, which currently operates on 160 M through 24 GHz.

So, is this a scam? Does anyone have any experience or information regarding
this commercial/educational TV broadcasting arrangement and can you report on
how it has worked and with what kind of problems?
I intend to go to the school board with my concerns but it would be
extremely helpful to have some references to point to.

Thanks for any help. Responses by e-mail gratefully received and summarized.

From: dlp@zule.EBay.Sun.COM
Message-ID: <7253@male.EBay.Sun.COM>
Source record: 295629

I want to put a 2 meter glass mount antenna on my Cherokee, which has very dark tinted windows for all windows but the windshield and the front side windows. I wanted to put the antenna on one of the rear windows instead of the windshield. The guy at the local ham store told me that dark tinted windows use a metal oxide and doesnot work well with glass-mount capacitance coupled antennas.

Can someone either confirm or provide a different opinion on this? First hand experience would be great.

> Kenwood TS-940S vs Icom IC-765
>

The Icom is better because I like Icom :-).
Seriously, I predict a 50 - 50 vote. This is a pretty subjective
matter (ignoring published specs, which I never believe). I have
never liked Kenwood (don't know why, I just don't... I don't like
spam, either) but there are a lot of happy Kenwood owners. Same
applies to Icom owners. Both companies probably have some un-happy
customers, too (don't know how they could avoid it).

If I were to offer any advice on buying a transceiver, it would be
the same advice I give on hi-fi equipment:

Play with the system, look at what you want vs what you can afford
and buy the one you like best.

> for is an idea about the position of the diode(?) relative to the center
> line of the cavity.
>
See the IEEE Transactions on Microwave Theory and Techniques from August 1971. There is a paper titled "Theoretical and Experimental Analysis of a Waveguide Mounting Structure" written by Eisenhart and Kahn (pp. 706-719).

This paper gives an analysis of predicting (with high accuracy) the impedance seen by a device placed arbitrarily in the waveguide. It is then possible to match the diode to the waveguide circuit by appropriate choice of waveguide and post dimensions.

Basically, the analysis obtains the dyadic Green's function for the rectangular waveguide by using the Lorentz reciprocity theorem (which relates the electric field and current density at two different locations). This then allows the impedance to be calculated.

You might also want to look at another Eisenhart and Kahn article, published in the IEEE transactions on Electron Devices from September, 1972. This is titled "Some Tuning Characteristics and Oscillator Conditions of a Waveguide Mounted Transferred-Electron Diode Oscillator" (pp. 1050-1055).

> (Aside: how does the characteristic impedance vary
> within a waveguide? low-high Z, centre-wall?)

As above, you would have to relate the electric field and current density, obtained from the reciprocity theorem. Off hand, I do not know of any references where this analysis was published. You might want to check the IEEE publications index, or some of the other journals in the microwave field.

I hope this information is beneficial!

624. 1/4-wave, 5/8-wave....

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-24 16:29:11 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <24.Jun.91.17
Source record: 295705

The 1/4 and 5/8 wave antennas need a conducting groundplane of low impedance that extends several wavelengths in all directions from the base of the antenna (ideally an 'infinite extent' groundplane but the difference between, say, 10 wavelengths and infinity is probably near the limits of practical measurement technology). if the groundplane is of non-zero impedance it affects the antenna efficiency.

The 1/2-wave, being voltage-fed (i.e. its feedpoint impedance is high) is much less susceptible to the effects of earth impedance. Thats why 1/2-waves are good for HT's; *you* are a component of the earth impedance as seen by the antenna/radio combination.... The earth impedance essentially appears in series with the feedpoint impedance of the antenna; if your earth impedance is, say, 30 ohms, it will have a far greater effect on an antenna which is current fed (like a 1/4 or 5/8 wave) whose end impedance is less than 100 ohms, than on voltage-fed antennas such as a 1/2-wave with a 5000 ohm feedpoint impedance.

I use a 1/2-wave endfed on my fiberglass-bodied car; it works.

I did not want to strip out the roof lining to fit a groundplane of mesh, aluminum foil or anything like that, and attempting to fit a 10-wavelength-diameter groundplane for 2 meters would do horrible things to the aerodynamics....

Note that voltage-fed antennas have *high* voltages on the feedpoint; several kilovolts of RF may be present if you run appreciable power; this requires good insulation of the matching components and antenna base. It also means you can get RF burns from the antenna.

One military mobile installation i know of actually employs a small 'fence' round the base of the antenna (mounted on the cab of a truck) to keep G.I. Joe from touching the feedpoint when it is hot, and microwaving himself on 2.5Kw of RF. The usual demonstration of the risk is to draw a nice fat RF arc of about a foot long from the voltage node (about 6 inches up the element from the antenna base) using a grounded metal probe.... Sure makes an impressive sound, and looks impressive (specially at night!!)

625. R390A receivers -- Research Study/Call for participation

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-24 17:33:27 UTC
From: dennis@tfsg.UUCP
Message-ID: <1142@tfsg.UUCP>
Source record: 295694
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

<>

A friend of mine and I are conducting a research effort regarding the R390A receiver. Our goal is to determine the number of production runs, how many units were produced in each production run, and who the customers of each production run were. In order to accomplish this, we need the help of all current owners of R390A receivers. If you own an R390A receiver, you can help by sending me (via email) the following information:

1) The order number of the receiver. This is usually stamped on the metal tag in the front panel. Please be sure to include all letters and digits shown.

2) The contract number of the receiver. This may appear on the metal tag on the front control panel, or it may be stamped on the rear of the receiver. Please be sure to include all letters and digits shown.

3) The serial number, which is on the metal tag on the front panel of the receiver.

4) The name of the contractor who made the receiver. This is usually shown on the metal tag on the front panel. As far as we know, this is usually one of the following: Collins, Motorola, Capehart, Amelco, Imperial, Stewart-Warner, or Electronic Assistance Corporation.

5) If possible, please try to confirm the approximate date of manufacture. You can do this by examining some of the internal components, often the dates are stamped on the side.

NOTE: Some receivers have only an order number, and no contract number. In this case, provide the full order number shown, and indicate no contract number was shown. Usually, units that do show a contract number also have an order number as well. Also, PLEASE NOTE that this study only covers the R390A, and NOT the R390 (without the A).

Also, it might be helpful if you can indicate the general location of the place (City, State) you purchased the radio. Any other general information you would like to provide would be helpful as well.

We intend to post the results of this effort on the net, but how quickly it gets done depends on the amount of response we get from current owners.

Thanks for any help you can provide!

>
>Yaesu makes a AA battery pack for $12...
>
>73's John KC6OVN

True, but the version for FT73s (I forget the number .. FBA10 ?) comes with a little slip of paper that warns against filling the pack with nicads. This may be merely protecting their overpriced battery packs (30 UK pounds for an FNB10), but I opted for safety and added a small series resistor and a thermal fuse.

A friend involved in commercial radio repair tells me that the screws visible when you remove the battery pack sometimes fall out, shorting out the battery pack terminals. If you have an official Yaesu pack, it makes a regular clicking noise as the trip constantly cycles power to the short circuit. If you have a pack made out of AA nicads, I suppose it trickles down your arm ...

>and the police operator refuses to respond, he/she is liable for fines,
>jail, loss of licenses, etc. But I keep forgeting, Police don't have to
>obey the laws :-).

The Illinois Vehicle Code (my copy is at home so I can't post an exact
citation at the moment) says something to the effect that, in an emergency
in the road and/or involving vehicles and people, that I (as a driver who
happens on it or sees it) should contact the appropriate authorities by
the fastest means possible.

Well if my OOB modified HT is in the car with me, and if I know the frequencies
for these authorities (which for my local area I do, with PL) then that radio
could well constitute the fastest possible means under a literal interpretation
of the IVC. Sure, if I had a cellular phone, that would be faster because one
must account for the dispatcher confusion time on the radio. If there is a pay
phone on the sidewalk nearby, that, too, is faster for the same reasons. But,
there could still be cases where that radio is indeed faster.

I would not want to violate the Illinois Vehicle Code by failing to use the
fastest possible means, now would I?

I someone needs the citation, I can followup with it later on.

628. Alinco DR-590T News

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-24 18:09:03 UTC
From: drn@hpctdlb.col.hp.com
Message-ID: <32040007@hpctdlb.col.hp.com>
Source record: 295717

I just returned from a 3 week business trip to Japan, with part of that time spent in Osaka, where the headquarters for Alinco is located. During that time, I was able to spend about 90 minutes with Kazuhisa Azuma (International Sales) and an engineer to discuss the Alinco DR-590T. Here are some highlights of that conversation.

1. In Japan, the Alinco brand is known as "Cirfolk." The current Japaneese version is the Cirfolk DR-592SX/HX. The 592 replaced the 590. The most noticable change was that the earlier Japaneese version used LED displays where the 592 uses LCD like the US 590T version.

2. The "domestic" version (SX/HX) receive AM aircraft band, which was confirmedby a trip to a local HAM store.

3. I picked up a published version of the DR-590T service manual complete with schematics and component locators. The diagrams do not show any of the aircraftreceive circuitry, not even the connector located on the VHF board.

4. I was able to get photocopies of the VHF board and "AM Aircraft" board for the Japaneese version. The "AM Aircraft" board is really an additional RF front end, including RF amp. In addition, the main board has about 4 more transistors and a hand full of Rs and Cs. They are for the AGC and AM detector circuit. All are "chip" varieties.

5. There are additional boards that are either standard, or available to add 300 mHz and 800 mHz receive to the UHF portion. I think this must be an option of some type since the unit I saw at Alinco did not have this capability, but the one I saw in the HAM store did (extra coax connector for 800 mHz).

6. Alinco is planning a new US dual band mobile radio to add these features to the existing 590-class radio, with introduction sometime near the end of the year. This confirms your info, Jay.

My impressions are that Alinco is trying to better understand the US amateur market. Cirfolk is not one of the top radios in Japan (Yaesu, Kenwood, and Icom in that order) as far as popularity goes.

Finally, it appears to be technically possible to modify a DR-590T to receive the aircraft band. It will take more that just an additional board. Chip caps, resistors and transisitors are required, plus the knowledge on where those components go. From what I can see, the "raw" pc board is the same for both US and Japaneese versions.

Clearly multipath plays havoc with FM audio quality. However, I, too,
fail to see how changing the 'gain' of an omnidirectional antenna can
so significantly affect the audio quality. Maybe the answer lies elsewhere,
like in RF getting back into the transmitter low level stages. Also, a
repeater with audio playback would be really handy to check out reports
like this... It should be obvious whether a 'washed-out' FM signal is
caused by poor audio or lack of signal strength, but I've learned to
not trust most reports I hear from others.

>tower.

Crank-up towers need guying just as much as standard towers do -- maybe
more so. I believe you can buy free-standing (no guy) towers in both
the crank-up and standard variety. I am not a fan of crank-up towers.
Almost everyone ends up climbing them eventually for some reason (although
the tower manufacturers say this is a no-no). They're OK if you are not
too in love with your fingers and toes.

I feel it is safer (altho scarier) to just buy a good safety belt and
Rohn 25 tower sections and guy it per the Rohn spec. (This is also
cheaper than a crank-up.)

>a matching coil. The 5/8 on the other hand does require a groundplane and a
>matching coil. Which works better on, say, in the center of the rooftop of
>my car?

The 5/8, no contest. The fact that the 1/2-wave dipole doesn't *need* a ground plane means that it's also happiest without one - placing a ground plane (the roof of your car) next to one end of the diploe with Disturb It Greatly.

Also, I'm not sure I'd agree with the idea that the 1/2-wave dipole "needs a matching coil" - if fed in the center, the feedpoint impedance is about 73 ohms, close enough to 50 for a good match to just about any rig. (Now, if you're talking about something like end-feeding it or some such, THAT'S a different story!)

Well, I am not a ham (at least not a ham operator), but I have spent
some time in the Carribean courtisy of the US Army. It was definitely
the most enjoyable time I spent in. The beachs and water are fantastic.
I was in Puerto Rico, and I found the people there to be very friendly.
Of course, if you're not into the ocean, you probably wouldn't enjoy it
as much as I did, but there are other things to do as well. How long
will your stint be for?

I know about the ICOM R7000 and the Yaesu FRG9600. What else is
there? I'm not interested in any "hacks" such as interfaces that
kludge into the keyboard, or something that tricks the local oscillator
into demodulating a different frequency, just units designed to accept
RS232.

I'll post a summary of replies and followups.

I've received a plea for help from a school radio club in Warminster, PA.
They've received an HP-9816 computer system as a donation and would
like to use it for packet and for tutorial purposes. But they are
having trouble getting it all to work. They really need an "Elmer" to
guide them. Is there anyone who can help them get their system working,
particularly the serial interface to a packet TNC?

Please email me, I'll put you in direct contact with the school's
club advisor (a ham).

Thanks.

Thanks to the several folks who sent me operation tips on this
rig. I got the ticket (KD4BTC) and a manual (from a friend of a friend)
on the same day. Now just one more question. I'm a volunteer firefighter
and carry around a commercial HT on 154.19 mhz. Having the 2600 be able
to xmit on that frequency would give me a nice backup. I know that it's
not type accepted but there have been a couple of times when the Motorola
HT was dead and getting back to the dispatcher could have made a difference
and in one case, may have saved a life. So...If I can find the mod
instructions, I'll do it, and if the situation arises again, I'll use it.
Thanks in advance.

When you visit the US, you can take the license exam and get a USA callsign just as any US amateur does. Alternatively, you can get a "reciprocal license" if you are already a licensed amateur in Japan. Contact the JARL or ARRL for current information on reciprocal licenses.

No; but if you don't need compactness, it might be cheaper and more versatile
for you to pick up a used 2m amp and a VHF/UHF duplexer, and buy a 440 amp.

A while ago I asked if anyone had problems with lights on Alinco DR110T burning out, and how Alinco responded with service. I got my answer. I sent my radio to Alinco on 12 Jun, and got a replacement radio (complete with mike and mounting bracket) on 24 Jun. They sent it back the same way I sent it, 2nd day air (from Georgia). I think Alinco is a serious contender for Ham customers, and this proves it. BTW, I received lots of replies from other DR110 owners, that had same problem with the lights, they just don't last anytime. While I am happy with Alinco's service, I would not recommend anyone buy a DR110.... get the DR112. 73. AA4DU.

There's no need to be concerned about climbing towers -- in any community there's always someone who loves to climb. You shouldn't be doing tower work alone anyway, so just make some friends and all the climbing will get done for you. (Personally, I hate going to tower parties where they don't need me to climb, and will often climb anyway when the work is done... very few things are as pleasant as being strapped to the top of a tower.)

As a memorial to V31BB, I went to the MFJ booth at Dayton this year,
and sent "CQ CQ CQ DE V31BB V31BB K" a few times.

Anyone know how to load an MFJ memory keyer? I'd like to go to their
booth next year and program one to continuously transmit his callsign. I
wonder how long before someone would notice.

Yes, I have a R-F Concepts 2-70 Amp and have been quite happy with it. With my Yeasu 470 it puts out 33 watts on 2 meters and 24 watts on 70 Cm. Advertised ratings are 30 watts on 2 meters and 20 on 70 Cm. I also am using a Larson Cool rod 2-70 dual band antenna with this setup, and it works together quite well. The FET preamp of the R-F Concepts amp also works in fringe areas quite well, but in heavy trafic areas it also amplifies the intermod. Unless I am out in the country side I usually leave this function turned off.

(sorry Dube, I don't have your e-mail address)
CPDVAX::DUBE 24-JUN-1991 08:53:26.80 writes:

>However, I was a little chagrined that my statement that I don't buy the
>fact that you need to be a Ham in order to be in MARS was attacked, then
>followed by several screens of prose that tend to support it.

Sorry about that Dube! I admit that when I read it over I also saw where
it could have been taken as an attack but I was hoping that all would see
what I was REALLY trying to get across. I apologize for any ill feelings
generated as they were not intended.

What I was trying to get across with that kind of "sarcastic" response was
that this is exactly the same kind of treatment you get if you ever question
Navy-Mars people on why things are done certain ways. Let me be a little
careful here... I am NOT talking about civilians, but military hierarchy.

>I read in one of the postings that there are training nets. If MARS isn't
>into training, then what are these for?

I never said that they were not into training Dube... they are. But not
TECHNICAL (i.e radio theory) training. They are into procedural training
BIG TIME! That is why I said that they can "instill discipline".

>If military MARS members can't operate equipment more complex than "on-off,
>channel-select", then why must their civilian counterparts be any more
>technically adept?

Good question actually. Economically speaking not too many people, whether
they are hams or not... can afford $12,000 for a radio which is what a
complete Harris station goes for (more than that actually). But technically
speaking, I think that you have a point here. Try talking to them about it..
..... :-)

>Okay, okay..
>I'll accept the argument that "it's in the regs". As Mark stated, frequently
>"the regs" is the only thing that counts. But this still doesn't modify
>my opinion that one shouldn't have to be a Ham to operate MARS.

Everyone has an opinion... you are obviously welcome to yours! The point I
was trying to make is that your opinion is not going to MEAN too much! Mine
either Dube, so that is not a slur.

>At one time I was a "trained military radio operator" (I also knew how to
>string phone wires through trees and set up switchboards and com centers, both
>wire and radio). But I never was a MARS member. For years I wasn't a Ham,
>but I was fully up to speed on military com, even as a civilian. I'd like to

>think that I could have been a MARS member and not been rejected simply
>because I didn't have a Ham license.

Sorry, you couldn't have been... no matter how much you knew (know) about
military comm. Hey.. talk to THEM about it, and when you are finished, I'd
really LOVE to hear your story! :-)

>The pervasive truth of Mark's statement that "it doesn't matter what (I)
>think" is apparent when considered in the light of military rules and regs.
>I still don't buy it, Mark, but I did enjoy your article.

Dube, I am glad that you liked the article :-) but what is "pervasive" about
what I said? I am sorry, but the fact of the matter is, that in the military
it is a very rare occasion where the individual's opinion matters... unless
the "individual" happens to be pretty far up the rank structure. "Rank has
it's privileges" is a well known term and biggest privilege that I think comes
with rank is being listened to when you express your opinion! :-) However,
as a civilian I wish you good luck in influencing a change in military policy
and regulation structure. If you don't buy that... well, then give it a shot!
If you get it changed let us all know:

1. How you did it.
2. How hard was it?
3. Are you still sane?
4. Was it worth the hassle!

You might have thought (through all this) that I was disagreeing with your
opinion(s). I was not. I was simply playing devil's advocate based on
my own personal experience. Actually some of your ideas make a lot of
sense (!) to ME.

I am glad that you enjoyed the story... I might as well end with another
that tends to demonstrate my point.

First let me say that I left the Navy-Marine Corps MARS program 2 years ago
when I no longer could live with it, knowing how (too many) of the Marine
Corps MARS stations felt (and treated) ham radio operators. That sets the
stage.

In August of 1990 my job (as a civilian) tasked me to deploy to the island
of Bahrain in support of operation Desert Shield. Immediately after I got
there I saw the value a MARS station would have for the moral of the active
duty military men stationed there, and it was a MAJOR base even though CNN
didn't get around to reporting from there (thankfully!).

I went to the local military folks and tried to get them interested. NO WAY!
What money they had they were using to buy a TVRO satellite system to put in
the "O" mess. Concurrently I was also working on an individual Bahrain ham
license (which came through by the way and set the precedent for others to
also become hams in Bahrain - A92FL .. but that's ANOTHER story) Finally I
gave up on the military and started to work on getting a 3rd party traffic
agreement with the U.S. and Bahrain. A few Congressman and the State
Department got involved with this, and it was ALMOST finished when the war

ended.. but I don't think that anyone is pursuing it anymore. By the way the ARRL was absolutely NO help in this regard and in fact scoffed at the idea when first contacted.

Anyway, I then started trying to get equipment sent over.... I tried again to go through the MARS program. We contacted the home base MARS station where we had deployed from and this MCAS MARS station said that they could not "spare" any equipment. Realize that the whole base back in the States was effectively DEPLOYED at this time! They had 4 or 5 complete HF stations, but could not loan ONE out! Then I tried to go through the local civilian MARS people and the immediate reaction was: "You are no longer a MARS member ... what are YOU doing getting involved with MARS?" Can you believe that? They were more interested in the fact that someone who "quit MARS" was involved than they were in helping thousands of military members!

I then went the Amateur Radio route. Well... talk about a different story! KM4OX Danny Hampton in Raleigh N.C., sent over a TS-440S. I purchased a 50 foot Rohn Tower and KLM Log periodic and also three Cushcraft A3S antennas (for the local Bahrain hams and club). WD4JRK Louis Ingram sent over a TL-922 amplifier. One of the guys that had attended my ham classes (another story) built a 4 element wide spaced monobander for 10 meters. WD4DCY Hubert Buck, coordinated the whole thing and made numerous trips to Wilmington N.C. to buy parts and pieces and to pick up the Log and tower. Ham Radio comes through AGAIN!

The unit I was working for had a MARS callsign, but we had to certify that it was "approved" for Desert Storm, and that took another full month.

In the meantime, another MARS station sprung out of the woodwork! A Construction Battalion (SeaBee's) arrived on the base with their OWN MARS station ready to go! They immediately put it up, and then restricted access to it for their own people only, and would not allow the thousands of other military members access to it. Yes... that's illegal according to MARS regs.. but they did it anyway. They also never got permission from the Base Commander (Bahrain Commander) to operate and were technically operating illegally anyway! So... back to the drawing board!

By this time we had built a station out of an old ammo shipping container, and had a long wire and the 10 meter beam up and running. Getting permission from the Base Officials was simply a matter of fixing the Commanders personal TVRO dish, and from there is was Carte-Blanche! We finally got approval to "use" our old MARS callsign, but we could not use the 10 meter beam because the MARS frequency allocations are right in the middle of the CB "Freeband" and they made operation impossible (yes we tried). But in the end we used the longwire (800 feet long and 100 ft. high delta!) and an antenna tuner sent over by another ham, to get on the air.

And yes... in the end we ran a few thousand phone patches on MARS. It only took 5 months and the support from HAM OPERATORS (NOT in the MARS program) to get it done. The military MARS people gave us ZERO support and ZERO help other than the use of the frequency and the OUTSTANDING support of the guys on the other end (civilian MARS people) in actually running the phone patches.

My PERSONAL expense in this was about $2000 and was worth EVERY CENT! However, to me it was another experience that verified my feelings about why I quit MARS 2 years ago.

And by the way... I never operated the "MARS Station". I just trained other service members on how to do so.... you see one of the main concerns of the MARS people back in the States was that I (a civilian) not "operate" a MARS station with no valid MARS affiliation, even though I either arranged for or purchased the gear needed to get it going, even though I was a retired Marine, even though I got the MARS license for the unit to begin with, even though I was training the active duty MARS operators, and even though I was attached to the unit WITH the MARS callsign by DOD directive! None of that mattered, because the regs did not provide for ANY exceptions!

However, I must admit that I had a hell of a good time operating with the A92FL callsign!

I have been replying to requests like this via e-mail, but there seems to
be a fair number of new-comers to this newsgroup, so:

Gopal (and others who may be looking but haven't asked yet):

Welcome, I hope you enjoy reading and participating with the rest of us
here on the newsgroup. Since you are looking for information, let me
point out a couple of sources you should follow up on.

First, this newsgroup (like most) has a Frequently Asked Questions post
about once a month. Diana Syriac (KC1SP) is kind enough to maintain the
amateur radio FAQ and now posts it in 4 parts. I believe you'l find it
very beneficial to keep a copy of it for reference. It covers both points
of the original question and much more besides.

Second, although this is covered in the FAQ, two very good sources of
information concerning amateur radio are:
W5YI, one of the national Volunteer Examination Coordinators --
Fred Maia is a gentleman with a very great concern for helping people
who want to become licensed. To order materials from W5YI, call them
at 1-800-669-9594.
ARRL, also a national VEC, publisher of QST, and the largest "voice"
of amateur radio in the U.S. Not everyone agrees with all aspects of
the operation and scope of the American Radio Relay Leaque, but it is
certainly true that they provide many services, including license materials,
technical manuals, QSL routing and info, DX organization, public service
info and training, and more. They are the best source of information about
using amateur licenses from one country in another. They also have intro
to amateur radio packages available. Write them for info at ARRL, 225 Main St.,
Newington, CT 06111 - or call at 203-666-1541.

To those who needed this info, I hope it helps; enjoy whatever aspect of
amateur radio YOU like - you will certainly find someone here on the net
who shares your enthusiasm.

To those you I have bored because this is all old hat, I apologise. I hope my doing this once in public here will save a lot of bandwidth in the weeks to come.

To all -- Cheers & 73

Source record: 295628

I would appreciate hearing from anyone who has had success
in having the MM-3, PK232 and a computer exist in harmony together.
The documentation for both the MM-3 and PK232 state in various
places that it is feasible for these 2 pieces of equipment to
co-exist and work together.
I called AEA Tech support and was told that "YES" it is
feasible but that no one that they know has tried it. I find this
hard to believe.
So, if you have worked with the above combination, I would
very much appreciate hearing from you. Please e-mail me at the
address below.

73,
Randy

>
>What I'm looking for now is the next level of suppression. Do conductive
>spray paints work? If so, any particular brands and where can I find

I suggest this test: Remove the coax from the back of the "rig". Terminate
the coax connector with a plug and 50 ohm resistor. If the RFI is still
there, you need shielding. If not, you probably need to move or
improve your antenna system.

I moved my dipole farther away from the house. This helped a lot until
the balun failed and I removed it. "Who the heck needs a balun?"
Without starting a "balun vs no-balun" war, removal of the balun
on my dipole made it impossible to operate. That's quite a difference.
Feedline unbalance made the coax, which was much closer to the
noisy computer equipment act like an antenna and pick up the birdies
(Long explanation omitted).
(Balun Haters..cool it..I ended up with a tuner out under the antenna).

I would try this before spray-painting your equipment. Remember the
plastic panels!

Good Luck

Yes, you are. All that is needed to qualify to be tested for any amateur license is enough identification to show that you are who you say you are, NOT that you're a citizen. Welcome to the USA, good luck in the pursuit of a degree, and I hope to see you on the Ham bands soon!

Message-ID: <9106251733.AA15149@ucsd.edu>
Source record: 295635

Just saw the request for Braile Ham/Tech literature. --Recently, visited a relation - blind from diabetic retinopathy - and demonstrated my 2M rig and HF TS520 I had put in my car for the first time. During the demo a traveler needed a route and my relative was able to guide him. You can guess the reslut. He is more than willing to learn more about hamming.

I found three names of blind hams in his area - even though they are 125 miles away - Boise, Id to his QTH in Twin Falls, ID. He will have access to guidance to more info than I can give him. But, for my own curiosity and for others who might like to know - what sources are there that cater to the blind such as a braile ham rag? I have heard of voice synthesizer that can give power readings; can the same be done for freq. readouts? Other pertinent questions can most likely be answered by blink hams who I'm sure would like to share them. Please post these on this board.

Thanks. Rob N7KCG

The only dimension that is not critical in a waveguide cavity is the height of the cavity. All other dimensions affect the tuning and match of the cavity oscillator.

>the distance between the center of the Gunn diode and the iris; this
>distance distance has a profound effect on the operating frequency. The
>other matters (back-plate distance, off-center distance, altitude of the
>diode within the cavity) are (from my limited reading and experience)
>not very important, at least as far as maximum power output is concerned.
>Of course, keep the back-plate a quarter-wavelength from the diode.

No! The gunn diode's position from the short at the back plate must be such that an impedance match exists. This can be done by using a Smith chart, and moving the diode a distance from the short that provides a match to the combined diode/mount impedance. In practical designs, this distance is about 1/10 guide wavelength.

The distance from the gunn diode to the iris, and the iris dimensions are also very critical. The diameter of the iris determines both the relative impedance the iris presents to the guide at its location, and the amount of power that will be allowed to be extracted from the cavity. If the iris was closed (eg, was just a short), the proper location would be 1/2 guide wavelength from the short behind the gunn diode. The problem with this is that you get no power output. To get power output, you must make the iris be open somewhat. the smaller the iris, the higher the Q of the cavity, and thus the purer the output frequency. The larger the iris, the lower the Q, the more power output, and the greater amount of phase noise in the output. Thus the iris size is largely a design tradeoff. The iris also effects the resonant frequency of the cavity. The larger the iris (for a given iris position) the lower the frequency. This means that you must go back to your Smith chart, and position the iris at the proper distance from the back of the cavity to provide a match at the frequency of operation.

665. Cornell Amateur Radio Club, W2CXM -- Field Day

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-25 18:33:15 UTC
From: payne@theory.TC.Cornell.EDU
Message-ID: <1991Jun25.183315.22441@batcomputer.tn.cornell.edu>
Source record: 295633

The Cornell Amateur Radio Club, W2CXM, put in its annual field day effort. We operated from a hilltop overlooking Ithaca, NY to the west. The site is currently home to radio WVBR and was a former site for a slew of public service users, which means there were a lot of useful poles and towers sticking out of the ground.

We were 1A: a Kenwood TS-440 and "free" 2m packet station. On HF we had a 2 element beam at about 70 feet on 10-15-20 and a trapped dipole for the bands down to 160. On 2m, we had 30 watts into an 11 element beam at 35 feet. Power was supplied by a 10kw, 1940's vintage, cast-iron monster which idled through most of the weekend (even with both transmitters keyed down and all the lights on). The shack was a pop-up camper.

We ended up with over 1000 contacts, mostly on phone. 20m phone was our bread and butter for most of the weekend: it was almost always open. We worked 20/40/80 CW through the night. We had pretty much given up on 10m when the band opened wide at noon (EST) and carried us through the end (at 2pm, local time).

The packet station was our grand experiment. We used a Mac+ as a terminal thanks to its "RF-quietness". We made over 40 contacts: only one was direct, all others were through digis or network nodes. We made several contacts in the eastern Mass., NH, Maine area: 350 miles east of us. Working VHF contest packet is very different than "conventional" contesting. The usual mode for contacts is through conference nodes (called "CROWD"s around here) or DX spotting clusters. You just sit on the CROWD and wait for people to check in, then you give your exchange: very laid back. When things got sparse, I went hunting through the maze of Net/Rom, KA, and TCP/IP nodes and managed to coerce about 6 non-Field Day stations into giving me a contact.

All in all, things went very well. The only thing close to a problem was our packet station having trouble demodulating s9+40 packets. A 2m pre-amp late Saturday helped a bit, but we *still* don't know what the problem was.

We got the publicity, packet, and W1AW bulletin bonuses.

Participating were myself N8KEI, John KB2MTI, Steve N2BU, Jon AK8V, Dennis "hired fist" WA2PKP, Harry N2KNM, Don KB2HEE, and Martin N2KRV.

"A fun time was had by all" See you next year!

OK, let me offer you a few. There are a few places the French tricolor flies that a lot of hams would love to add to their QSL collection. You could become a VERY popular fellow if you could situate yourself on Glorioso Island, FR/G. Don't like that one? Then get stationed on Juan de Nova (FR/J) or Europa Island (FR/E). These are all three near Madagascar, and I hear the climate is just fantastic. Failing that, how about Amsterdam or St. Paul Island (FT8Z)? Those are the French possessions I'm still looking for. You could still be a hit from Crozet, Kerguelen, or Tromelin Island. Any of those would keep you busy for weeks working the pile-ups down to size. Good luck!

I was with the W6BB/NALCO setup at Lawrence Hall of Science, and can't address any of the HF issues, because what I did was set up an Oscar 13 ground station, for the first time ever, and we made about 20 QSO's using AO-13. It was exciting for everyone.
Thanx partcularly to N6EEG, who Elmered, and W6/DL5KR who was unfortunately unable to attend.

Deep Creek Radio Nerds (WA3WHE) Field Day Operation

Conditions at Deep Lake in Western MD pretty much mirrored every one else's comments: 10/15 basically useless, 20 M annoyingly unpredictable, 40/80 fantastic. We were 1A with my TS 850, a G5RV, and a really neat homebrew satellite station consisting of a wood'n'wire 2M quad, Cushcraft crossed 450 Mhz yagi, an R2000 with VHF converter and a modified UNIDEN 10 M rig to drive a transverter. We made about 45 satellite QSOs and would have have had a lot more except for the rain.

On HF we had about 600 QSOs, with no one staying up
past midnite and we shut down by 8am Sunday. The last few years FD has turned into a bunch of ham families on vacation, so our goal is to always increase our QSO count while decreasing our operating hours! What helped this year is that my non-contesting buddies finally got "religion" and saw how much faster the contacts roll in when you call CQ. For a pretty rinky dinky set up we had 180 contacts in two hours on 40 SSB, whereas usually the other guys usually spend a lot of time trying to search and pounce for Wyoming and Montana (it is hard to get people to remember there are no multipliers in FD!).

What is the most annoying thing about FD? !!!EVERYONE ALWAYS SENDS THEIR INFORMATION TWICE AND REPEATS THE OTHER GUY'S EXCHANGE, AS WELL!!! The 850 is a FB FD rig: built in antenna tuner, memory keyer, and voice keyer, good filters, lotta flexibility. A couple complaints of mine match NJ2L's comments in July QST.

669. Review of RF Concepts Dual-Band HT Linear. . .

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-25 21:08:55 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1991Jun25.210855.23114@midway.uchicago.edu>
Source record: 295648

This is a re-post of my review of the RF Concepts 2/70G dual band linear
that I posted about 6 months ago.

I use the amp almost daily during drive-time to and from work - about a
30 min ride each way. I generally run the HT (24AT) at it lowest
power setting on 13.8 V and run the linear. Both are happy and run
cool.

The amp, although is has a significant heat-sink, will really heat up
running its rated power. If you intend to use it in this manner make
sure you have good airflow over the cooling fins.

Gary

```
=====================================================
==================== Re-post ========================
=====================================================
```
Just bought a RF Concepts 2/70G (2m/440 MHz w/preamp) linear for my HT
(ICOM 24AT) so I thought I'd write a few words about it.

So what is there to say. If you have a 24AT HT you know that this baby
really "cooks" running full power on 13.8v. In fact, I'm looking forward
to using this as a hand warmer when it *really* gets cold here in Chicago.
And, it is a good "timer" to disuade rambling QSOs that might otherwise
be deemed monologues.

Seriously, the 24AT just can't effectively sink the heat generated by
the 5+ watts of output on 13.8v. Also, I wanted to get a bit higher
power for my car and getting the dual-band linear was cheaper than buying
a dual-band mobile rig.

The power out is pretty much as expected. (Although my 24AT does seem a
bit "low" on 440 MHz). Here are the results running the 24AT and linear
into a dummy load.

2 meters
24AT power
setting 24AT (Watts) w/linear (Watts)
low1 .4 4.5
low2 1.5 15.0
low3 3.8 22.0
high 6.0 28.0

440 Mhz
low1 .2 2.6
low2 .7 6.5
low3 1.8 6.8

high 2.9 11.0

There are two models of the RF Concepts dual-band HT linear. One with, and the other without the preamp. The cost difference is about $20. I went for the preamp.

Amazingly, the preamp makes quite a bit of difference. In fact, its about a 2 to 3 S-unit difference. And, scanning with the preamp brings in stations that I couldn't even hear before.

Now For the Bad News......

SWR Protection

The user guide makes a big deal about high SWR and having the proper type of antenna attached. The "other" RF Concepts linears have high SWR stutdown protection. This unit seems not to have implemented high SWR protection to the extent that the higher power RF Concepts linears have (such as the 170 Watt 2m unit). When the user manual makes that big of a deal about warning about high SWR - it scares me. Why not just spend the extra $$ to implement good SWR protection than fry the linear ? Accidents do happen - shorted coax or whatever.

Transmit Power Degradation

You can use your HT hooked into the linear with the linear power amp switched "off". (Pre-amp and linear are independent). In this case the signal is routed through the linears switching relays (mechanical) and out through the antenna jack. My initial measurements show that you may loose as much as 30% of your signal. Worst was 440 MHz band where I measured 2.9 watts out from the HT into a dummy load, and 2.0 watts out into a dummy load when routed through the linear powered down.

Receive Signal Strength Degradation

Insertion loss is about 1 S-unit on receive with the pre-amp switched off.

Conclusions

Power out on 2m is expected. My power out on the 24AT seems a bit low but I have no doubt that the RFC 2/70G would put out the rated power on 440Mhz if I had sufficient drive. (440 Mhz 5W in / 20W out; 2m 5W in / 30W out)

Insertion loss is a bit much both on transmit and receive with the linear and/or preamp turned off. But, why would anyone want NOT want to run the linear ? ... especially with the large number of power levels available on the 24AT. The preamp is another matter. In the city, the preamp will pull in alot of stray signals and intermod. For stations that you can already hear the 2-3 S-unit difference won't make any difference. But, as I mentioned, that 2-3 S-unit difference does make a big difference for stations that you can't hear at all - now. You probably won't be able to talk (transmit) to these people... but if you're into monitoring.. then you're all set.

The warranty is confusing. The AES catalog says 5 yrs and 6 mo on the RF transistors. The label on the box that the linear came in says 1 yr / 6 mo. And, the user manual had the entire page that discussed the warranty and return policy "crossed-out". I called Kantronics and in fact it is a 5yr/6mo warranty.

You get a schematic (always good for prying fingers) and a 2 page mini-lesson on RF amplifier design. If you want to mess with the RF peak detector, resistor divider and comparator circuit that trips the transmit relay on other than the factory set .4W then you'll find that the technical writer has not forgotten you.

All in all, I'm satisfied. I now have mobile-rig level power from my ICOM 24AT at 1/2 the price that a dual-band mobile rig would cost. And, I can now also carry on a QSO using my 24AT in low power without it suffering thermal meltdown or me suffering 3rd degree burns.

RF Concepts (Kantronics) 2/70G dual-band HT linear w/preamp - $239 from AES in Milwauke.

670. Field Day 91! de AABNB

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-25 21:46:00 UTC
From: CSMSCST@MVS.OAC.UCLA.EDU
Message-ID: <9106252147.AA07707@ucsd.edu>
Source record: 295642

What a blast!! A group of ten of us operated AA6NB/N6VRI ("2Alpha Los Angeles") from the summit of Frazier Mountain in the Los Padres National Forest. Frazier Mtn is an 8014' peak with an mostly-abandend fire lookout tower and an small electronics site, located about 70 miles north of Los Angeles. It has a fantastic view, and is line of sight to much of the LA/Orange Co. basin to the south, Lancaster/Plamdale (and probably Las Vegas) to the east, and the SJ valley to the north. The LA entry point into the Condor 220 intertie system is on Frazier.

Perhaps the rest of you were too low - propagation from Frazier was quite a bit different that what you've described. I operated 15M from 4PM until about 9:30, and it was screaming. I'd often get 3-4 callers to a QRZ. When it slowed down, I'd kick in the voice keyer and let it call CQ for me, and pretty soon there would be a pileup again. We were still hearing W1's at 9:30, but we dropped down to 20M, which was open all night for us. That position was running a 440 into a Mosley TA33jr up 30'.

Operating 2m or 220m from a location like that has to be experienced to be believed. I worked a guy in San Diego who was using an HT with a rubber duck - that's about 175 miles! - and he was full quieting. We were running 50W into a vertical. The down side was QRM problems - I'd get a call from somebody in Tulare, who'd get stepped on by somebody in Santa Barbara or Anaheim. I appologize to anyone who tried to work me and couldn't get thru -- the freq may have sounded clear to you, but I could hear half a dozen stations calling. By the way, there are virtually no useable repeaters from Frazier - any freq you key brings up a massive hetrodyne of 4 or more machines (I wish CTCSS were mandatory.)

Our novice position really cranked on 10M (although most of the calls were 6's). They were running the basic 100W into a 3 element beam up about 30'. The lead op was a tech who'd had his ticket only a month. He got sort of glassey-eyed in the beginning with everybody telling him "write neater", "talk faster", "no dead air - call CQ", but turned into a veteran op by Sunday.

We ran a full satellite operation, and our OSCAR guru worked about 300 SSB and CW QSOs. But those weak signal people get

so excited when you key up a 50w rig 100 khz or so from their frequency ... So we let him have 2m and 440 most of the time.

Memorable calls worked: W1AW (but class D?? Come on guys, it's *FIELD* day), Gordon West, the 5yr old Tech, W6RO (Queen Mary). (Best phoenitics, tho, were a couple of yrs ago, about 4AM, when I worked K4CTH "Cold, Tired, and Hungry" - broke me up.) Best DX was England and Japan, on satellite. Other memories: syphoning gas from my car into a jerry can at midnight in a 30 mph 'breeze' to fill a thirsty generator -- do you have any idea how cold it gets at 8000' at night, even in summer? A troop of boy scouts out for a day hike getting introduced to ham radio. Learning about my physical and mental endurance, and what I might be capable of in emergency conditions. The warm glow of friendship. And 11:01 AM Sunday, looking at each other and saying "Are we crazy enough to ever do this again?" followed by "Hell, yes!"

We figure 2100+ QSOs and maybe 5500 points - I'm keying the logs in now. I swear I'm going buy everybody a laptop and make them use it next year.

The United States and India do indeed have a reciprocal licensing agreement.
Thus merely by supplying a copy of your Indian license you will have operating
privileges in the United States. You need to get a reciprocal operating permit
from the FCC, and I believe the 610 form is the paper to submit with your
license copy. I would suggest you call or write the ARRL for further info
if you can't get your hands on a 610 locally.

For what it's worth, I sure wish the Indian Ministry of Telecommunications
would process reciprocal license applications as quickly as I hear the FCC
does here. I have been trying since December to get a permit to operate
/VU4, and so far can't get any answer. I have the equipment ready and the
funding lined up to move VU4 off the top 100 list; now all I need is the
operating permit. Maybe you have suggestions for me on how I can speed that
one up?
Bruce Sawyer, AA6KX
license permits as easily as the FCC

I just came into the possesion of a 32S-1 TX today, and need info for it.

A few questions- Wiring of the power jack (does this thing use an external power supply, or one onboard the reciever or what?) Microphone wiring and tuneup info is also needed. The previous owner said the thing just plugged in, and he lost the plug, but the Collins doesn't have any onboard transformes, so I'm a bit concerned about that.

Please mail me with any info, so I don't miss it on the group, since things move too fast around here...

676. Field Day logging question

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 08:24:10 UTC
From: tad@ssc.UUCP
Message-ID: <1222@ssc.UUCP>
Source record: 295672

Can someone explain this to me? Why did I hear so many stations
in Field Day trying so hard to get the complete station class
and section from the station they were working?

In ARRL Sweepstakes, I can understand the need to get the exchange
right. You have to log it correctly. But in Field Day, you don't.
The only requirement is to exchange the info, but there is no logging
requirement. Under "REPORTING", the rules say:

"A complete entry consists of an official ARRL summary sheet and a
list of stations worked on each band/mode during Field Day, plus
bonus proof."

The rules go on to state that the list of stations worked is just
a dupe sheet, with no other info. It does say that you should keep
a copy of the Field Day log (but unlike Sweepstakes or other contests
{Field Day is an operating event, not a contest!} it does not define
what goes into the log) but says not to send it in unless requested
later by ARRL.

Not worrying about logging any times or the other station's
section or class really made things easier. But it sounded like
a lot of other stations were going to a lot of extra trouble.

I tried explaining to a couple of stations that they didn't need
to log ANYTHING, but they seemed incredulous that they didn't need
to log dates, times, sections worked, station class, etc, as if
it were Sweepstakes. I noticed that the official FD package
from ARRL HQ only had dupe sheets....no logs!

Anyone on the net here keep a log during FD?

The best form of military service is to challenge the authorities
and decide not to do any!!! What a nation to decide that all its
sons should be proffessional killers. If you are looking fro an
all-expense paid holiday then consider the other side of things as well.

With 1992 coming up next year you do not need a military service in
france anyway. Just exile yourself to Britain or somewhere (and you
would not be the only one!).

What happenned to Mai '68. We need another one to get rid of t5his
quasi-tyrany imposed by a system that every one accepts.

Well, that's real interesting. Knowing three Morse Code instructors from Fort Devens who are CURRENTLY teaching Morse Code, I'll be sure to tell them that they haven't been teaching Morse Code for over 10 years.......I think maybe you have your facts mixed up.

By the way, one of these Morse Code instructors asked me if I could give the Amateur Radio Morse Code test as character groups instead of as a standard QSO. Seems he has no problem at copying 25 wpm "the military way", but has real trouble trying to copy a standard QSO. I told him, "as long as all the characters are in the code groups, sure, I can give it to you that way, no problem!"

I've been an admirer of V31BB from the beginning because of _one_ incident I personally witnessed on 10m (I didn't hear the MFJ mess). He was chatting away from Ambergris Key, when some w2 idiot decided to call him while he was talking with another station. After about 10 minutes of this deliberate interference, Jim told the w2 station that he didn't appreciate the QRM, and that he might as well go away 'cause he won't answer him anyway. He helped enforce the supposedly 'gentleman's' nature of ham radio, and I think that took a lot of guts. He was always full of humor, and always good for at least one parrot joke. I miss him as well.

683. Field Day data requested

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 14:33:16 UTC
From: washer@sequent.com
Message-ID: <1991Jun26.143316.27531@sequent.com>
Source record: 295657

I am interested in 'analyzing' your field day data if you used a fixed antenna and can 'e-mail' the call signs to me.

Why? Well, we took our field day results and ran the calls thru the call sign database to pick up zipcodes, then ran the zip's thru our geo-database to make a map of our contacts.......and guess what..... as plain as day, the pattern was the characteristic dipole double lobe pattern. Well sort of. We were on the coast of oregon, so we only have half of the pattern.

So, if you have your contacts on line for a FIXED direction antenna and send me the calls, I'll send you a nice map showing your pattern. Also include your station call if you want it printed at the top of the map. Include your antenna orientation so I can 'check' the results....or not if you want to see if I can tell you what it was. Split the data by bands if you want individual maps...

Please send only the calls in some nice {awk,grep}able pattern...

This offers expires when I get tired of doing it. (i.e. after about ten of these I suspect I won't care any more).

684. 911 open autopatch summary...

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 14:46:59 UTC
From: trop@hls.COM
Message-ID: <9106261446.AA17597@lanslide.hls.com>
Source record: 295659

Well folks,

You may remember some time back I asked the question about what repeater clubs were doing for 'open' 911 emergency autopatches. I also posed a subsequent question about the sequence to close the autopatch. Here is a tally of the number of responses.

Of just 11 respondants:

3 - repeaters used *911 for open autopatch
6 - repeaters used 911 for open autopatch
1 - repeater used *9 for open autopatch
2 - listed abuse of the autopatch as a reason for closing the 'open' patch

4 - used # to drop the autopatch
1 - club-proprietary code for dropping autopatch

Respondants varied in locality from South Carolina to Hawaii. Notably two were from Austin, Texas, and the response from Hawaii claimed that most repeaters there used 911 and #.

686. Ham Plates....

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 15:04:13 UTC
From: trop@hls.COM
Message-ID: <9106261504.AA17760@lanslide.hls.com>
Source record: 295658

As long as I'm dredging up old things (i.e. 911 autopatches), let me
update an old debate about Ham Plates in California.

I orignally posted a specific request about how to get a ham plate in
CA after some other postings were listed for info in other states.
A debate soon entailed about what the requirements were and how long it
might take. Here's the scoop about CA ham plates.

One must go to/call the DMV and request a Amateur/CB call plate application.
The completed form must be returned to DMV with the $21 one-time
processing fee. Your current vehicle plates MUST BE SURRENDERED
at the time of application (a temporary permit is provided).

You should receive your plates in the mail in about 90 days. It may
take much longer depending upon the backlog. According to DMV Special
Plates Division, the ham plates are the only types that are still produced
by hand.

In my case, I ended up making the original request, plus two subsequental
requests through the Special Plates Div because DMV was unable to exactly
track the previous requests. Finally, after 6+ months, I received 2 sets
of plates 3 days apart. After checking with DMV Spec. Plates to determine
which set of licence plates tags were valid, I was able to keep both sets.

73s....

689. Field Day Llama Style

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 15:23:52 UTC
From: n2ic@cbnewsb.cb.att.com
Message-ID: <1991Jun26.152352.23187@cbfsb.att.com>
Source record: 295661

After operating 20+ Field Days, this year I decided to try something completely different. My XYL and I recently started raising llamas (yes, you read correctly, llamas). Why not use a llama for transportation, and operate from a location that is inaccessable to motor vehicles ?

Myself (N2IC), AA0AS, my XYL, AA0AS's son, and Cusi,
an 8 year old female llama,
hiked to Panorama Peak, just outside of Estes Park, Colorado. It wasn't a very long hike, since I didn't know what Cusi would think of carrying aluminum tubing and a car battery, amongst other junk !

After two llama trips, we got all of our stuff to the peak -
a TS-120, 14AVQ vertical, 20 meter wire beam, 200 feet of coax, 700 feet of rope, a car battery, 2 tents, 4 sleeping bags, 8 gallons of water, food, tools, keyer, etc., etc....

The llama only complained once about the load - by sitting down on the trail and refusing to move. It took about 10 minutes to coax her up. She got her revenge by trying to skewer us with the aluminum a few times.

We operated Class 1B-Battery, running 5 watts. The 20 meter wire beam worked as I hoped - about 10 dB better than the vertical. It was kind of neat to work K6STI using a beam designed with his YO software. My previous FD experiences with wire beams have not been as good ! The 14AVQ worked much better on 40 meters than I expected. 40 meters seemed much quieter than past FD's. I kept having to check the
wattmeter to convince myself I was only running 5 watts. 15 meters was the pits until around 1500Z on Sunday. 10 meters was virtually nonexistent. My previous 5 watt experience from K0NA convinced me to not even bring an antenna for 80 meters. The car battery held out better than AA0AS expected. The voltage dropped from 12.8 to 12.2 over the 24 hours. The battery started my minivan without a problem afterwards.
By the way, the TS-120 draws a staggering 4 amps to put out 5 watts of RF.

We ended up with 538 QSO's (467 CW, 71 Phone), for about 5400 points.

Thanks to everyone who strained to hear our QRP signal !

Steve, N2IC/0

>described. I operated 15M from 4PM until about 9:30, and it
>was screaming.

15 was good for me too. Not as crowded as 20, but no trouble finding people to work. I was getting some strange propagation on 15.. I guess you would call it a narrow skip range. I got something like 5 contacts in a row from Santa Clara Valley. With the beam a little more north, I got a bunch in a row from Oregon.

This was my first field day. At least for our group (RPI radio club, Troy radio club, and the county RACES group), it was as much "bring the family and set up the barbie" as it was a radio event.

I guess you guys missed the part of the rules about "The Novice/Technician
station ... should use the call sign of one of the Novice/Techinician
operators"

>
>The "UR" had us puzzled for a while, too; it stands for "yours is" or "the
>information for you to copy is".

I always thought it meant "You Are", (as in UR 599) but i guess the meaning
is the same.

>The final numbers: 110 phone and 30 CW contacts for 170 points. Is
>this good for a Novice station? I really have no idea. But I think
>all three of us know a lot more about operating a radio station in
>less-than-ideal conditions, and best of all, got our Morse code speed
>up towards the next license class.
>

I'd say that was pretty good for a Novice/Tech station. We could only
convice one Technician to come out and operate in a serious sort of
way, and he wouldn't attempt CW; thus just 3 local QSO's on 10 meter SSB.
We never did hear any sort of opening on 10 on Sunday morning, though I think
he checked several times.

Our main call was NN7N (Nancy Nancy 7 Nancy, and other more inventive
phonetics). We wound up with about 950 qso's total, and about 3500 points.
We were 2A class, WWA section, and we had just about all the
free-bee's; packet, Novice, and satellite. In fact, satellite got us
81 QSO's, and we could have gotten more if we'd paid more attention
to it, and put more operators on it.

We were grumbling *last* year because 10 never opened then. This year
15 was almost as useless. 40 was crummy, except in the wee hours. 80 ssb

wasn't too bad, but through some oversight we only put up one 80 meter dipole, and never did get on 80 cw, until it had shut down for the morning. 20 was the work horse band, giving us 650 of our 950 qso's. As usual we didn't have enough CW ops, although one of them did a fantastic job of wringing every last QSO out of 20 meters (good job K0KV!)

The barbeque/potluck went well though, and we finished the keg, a first for us!

693. DX Bulletin

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 16:25:31 UTC
From: skitch@NADC.NADC.NAVY.MIL
Message-ID: <9106261625.AA04341@NADC.NADC.NAVY.MIL>
Source record: 295663

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 016 (OPDX.016)
June 24, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, ARRL DX Bulletin, WB2REM, WK3N, KA5EJX, NA8A, W8GMH, KA8QMU, W8QWI, K8YVI and TI2TEB for the following DX information.

3D2, FIJI ISLAND. AA7AF/3D2 has been active on 7009 KHz around 0850Z, on 14012 KHz around 1200Z and on 18073 KHz around 0445Z. QSL via WA6ZEF.

4U1ITU, ITU GENEVA. This station has been very active this past week. There was activity on 40 meters CW. Also, 4U1ITU checked in on the 14256 DX Net and operated on 10101 KHz and 18083 KHz. Look between 0130 to 0330Z for 4U1ITU. QSL only to the Bureau or via the operator giving the QSO.

4U1UN, UNITED NATIONS. There was some activity by 4U1UN on RTTY this weekend. Activity was around 14085 KHz at 1207Z and 1707Z. Also check 21092 KHz around 2306Z. QSL via NA2K.

9K, KUWAIT. Plenty of 9K stations are on th air again. Look for 9K2EC on 18144 KHz around 2300 to 0030Z, 9K2NL on 21287 KHz around 2145Z and 9K2IC on 21279 KHz around 2209Z. Also 9K2DZ has been active on AMTOR (FEC) on 14078 KHz around 0116Z.

9U, BURUNDI. Larry, 9U5BZP, countines to be very active until June 28. He can be found on the 14256 DX Net around 0000Z. QSL via G4BZP.

D2, ANGOLA. This will be your last week to work D2ACA. Operations will QRT around June 24 or 26. Most of the operating is CW on 15 and 20 meters.

DIGITAL MODES.
On RTTY: 4U1UN 14087/1207Z, FB8WZ 14086/1316Z, FS/KB4VHW 14083/2345Z
HI8BG 14087/2259Z, HP1XBH 14088/0054Z, T77T 14091/0258Z,
TU2UR 14091/2352Z, VP8BFH 14088/2339Z, YS7OB 21083/2216Z
On AMTOR: 5N8ALE 14076/0142Z, 9K2DZ 14078/0116Z, 9Q5TE 14085/0626Z
9X5LJ 21073/0514Z, FK8BK 14070/0702Z

MEDITERRANEAN ISLANDS. SV8/OE6MBG from Kalamaki, Zalynthos Island was on 14179 KHz (IOTA EU-52). QSL to home call. ID8/IK8AUG from Dino Island was on 20 meters. QSL via IK8JVQ.

QSL CARDS IN THE MAIL. VK4MZ reported the Malpelo Island, HK0TU cards are now being sent out. The first batch of 700 cards were sent out June 20. They will be sending batches of 400 QSL cards daily. QSL cards from FR5AI/T are now being received (1 month turn around). YI1BGD QSL card was received with a one month turn around from the Austrian QSL Manager OE6EEG.

S2, BANGLADESH. OA4OS reported, Monday, on W2MIG's Net, that Eric WZ6C (ex-WZ6C/ST4) is now in S2-land signing WZ6C/S2. Also, OA4OS stated Eric had verbal permission only (usually not acceptable for DXCC), and can only operate on Saturdays and Sundays. Other sources report Eric has no permission at all to operate. Eric was on the South American Net on 14243 KHz for 1 1/2 hours this past Sunday. Later in week, it was reported again on W2MIG's Net, that Jim, VK9NS, talked to Eric and advised him that the U.S. does not have reciprocal operating agreement with Bangladesh. With this advice, it seems Eric has terminated his operations. Let's hope Eric can receive written permission and a S2 callsign. KYFC!!!

S21U CARDS. Jim Smith who operated as S21U says he will now handle his own QSL's for that operation, not JA1UT. JA1UT will continue to handle S21U cards for the Japanese operation only.

SV5, DODECANESE. Rod, KA5EJX, reports SV0HV has been delayed about a month for his SV0HV/SV5 Dodecanese Island trip. He will be on the island around the first of July. The island's IOTA number is EU-1. QSL to KA5EJX using only a 1990 or 1991 CallBook address.

USSR DXpedition. Jim, WB2REM, will be operating from the USSR signing U3A/WB2REM from Moscow and U6L/WB2REM from Rostov-on-Don. Operation will be 10, 15 and 20 meters until July 5.

YA, AFGHANISTAN. Some great news was reported by the ARRL DX bulletin. A group of Italian operators will be active from Afghanistan,July 12 to 29. Possible callsign will be YA0AS. QSL will be handled by IT9AZS.

ZA, ALBANIA. The ARRL DX bulletin also reported a possible July 11 operation by I3BZK and I3GJZ from ZA-land. (KYFC!!!)

THE WK3N WORLD DX NEWS REPORT .... Political unrest and problems within Yugoslavia indicate that Slovinia may succeed ..... Albania's new democratic government states its policy as pro USA .... Reunification of North and South Korea is slated for the late 90's. A situation similar to East & West Germany, so this should create yet another new DXCC Country!

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

Bob,
I don't think this is necessarily true. Take a look at the vertical radiation
plots for a half wave dipole in the ARRL Antenna Book. It turns out that
a dipole mounted with its center at lambda/4 has a very nice lobe-free
pattern right on the horizon. To get this pattern (and "ground gain") you
do need to have a well performing ground.
I used this characteristic many years ago on 21 MHz. I made a couple of
folded dipoles from twinlead and mounted them vertically with their bottoms
just above ground level. Then by properly phasing the drive to the two I
ended up with an extremely cheap, low angle, steerable beam array. That
antenna appeared to be pretty good competition for tower mounted yagis
when trying to work low angle DX. To perfrom well it does want to have
a good ground and few adjacent trees etc which tend to absorb
transmitted power.
Mounted on a large sheet of metal, like the roof of a car, I'm not so
sure that a vertical dipole with its end near the ground isn't a pretty
good performer.

My IC751a has the little option board (sorry, don't have the number here) which lets it speak the active VFO setting. Doesn't give you the split or mode though. The voice is female, and has a distinct Japanese accent. I can see how this would be handy in a mobile-operations context, as well as to the visually challenged. I haven't tried it yet (my d*mned truck is soooo noisy you wouldn't believe, s9 noise all up and down the bands).

>
>Thanks. Rob N7KCG

I am a blind ham; here's my two cents' worth. As far as I am aware,
there is no longer (at least in the United States) a magazine catering
to hams published in Braille. However, the Library of Congress, as part
of its National Library Service for the Blind and PHysically
Handicapped, does publish a recorded edition of QST on flexible discs
recorded at 8-1/3 rpm and playable on the special "talking book"
machines issued free to NLS patrons. There is also a magazine whose
exact name escapes me (I think it's known as Radio Digest) available for
twenty-odd dollars a year on casette; your relative's nearest NLS
Regional Library can obtain exact info on this. Bill Welch (his call
escapes me -- he was from California) used to put out courses designed
to assist the blind in becoming hams on reel-to-reel tape (that shows
you how long ago this was) but don't know if this is still the case. The
Hadley School for the Blind in Illinois has a correspondence course
designed to assist the blind in becoming hams; the NLS Regional Library
will have it's address also -- I can dig it up if you can't find it.
Recording, for the Blind, Inc. in New Jersey also used to have some
literature pertaining to amateur radio. Finally Handihams has materials
to help the blind (and other disabled) become hams. They have
representatives throughout the country who can either personally assist
prospective disabled hams in their efforts or who can find a local Elmer
to help the prospective hams. Handihams also used to have a limited
amount of used equipment which could be loaned to new handicapped hams.
My personal opinion of Handihams (and I know I'll get flamed for this)
is that they do a fine job but are a bit custodial (toward the blind, at

least) and tend to get caught up a bit with the virtue of their mission (as opposed to protecting the dignity of their students). However, as I say, they do a good job and are a valuable resource not to be spurned lightly. Apparently, ARRL also has some Handiham material (I've never seen it so can't say how good it is). Here's the material from FAQ3 on this:

** What organizations are available to help handicapped hams?
Courage Center
Handihams
2915 Golden Valley Rd
Golden Valley, MN 55422
(612) 520-0515
ARRL has a Handihams information package (get it by requesting it thru 2155052@mcimail.com) and a book called "The ARRL Plan for the Disabled", available at no charge from the ARRL Regulatory Information Branch.

As to equipment, Tentek used to make a device that hooked up to their transceivers which gave an audible readout of transceiver frequencey (this was around 1978-1980). I saw it a few times; it worked well with Tentek gear but, although it was theoretically possible to get it working with other gear (such as Drake), I never saw this successfully done. About 1983-1984, Kenwood came out with a 2M-70cm dual-band mobile FM rig which, as an accessory, had a very pleasant-sounding female synthesized voice to give you frequency readout and "power on" indication. I understand that a number of other HF and VHF/UHF rigs have speech-synthesizer boards as accessories which can give you various readouts (the boards are surprisingly inexpensive as accessories go). Asside from the Kenwood dual-bander, the only rig with synthesized speech readouts I've played with briefly was the Icom 6000A which I salivated over at the ARRL 1988 convention in Portland, Oregon. Science Products in Pensylvania (again, the NLS Regional Library will have the address) has test equipment modified for use by the blind, I own a modified Simpson 260 multimeter which I bought from them twenty or so years ago; it works fine. Be advised, however, that SF Products' stuff is expensive;; they're **definitely** a for-prophet outfit. If your relative owns a Ureka A-4 note-taker (a Braille keyboard input, speech output device from Australia marketed here by Robotron, Inc. and costing $2500 or so), there's a built-in facility for a multimeter already in it; all you need are the probes. I've not tried the Eureka in this application so can't vouch for its accuracy. In the past, when Mr. Vacuum Tube was king, there also were many circuits designed to facilitate tuning of transmitters via audio signals. QST (and other publications) have carried articles on these (beginning in the late 1950's).
Sorry for this ptome -- but you asked!
Good luck to your relative and prospective ham!

699. AEA CP-1 AMTOR help needed

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 17:55:16 UTC
From: tomg@hpihoah.cup.hp.com
Message-ID: <48210001@hpihoah.cup.hp.com>
Source record: 295595

I just purchased an AEA CP-1 with cartridges for the Commodore C-64 for RTTY and AMTOR from a local ham. Everything hooked up and works well except I can not get the AMTOR cartridge to do anything. I have the manuals for the CP-1 and the RTTY/ASCII/CW cartridge, but the seller lost the manual for the AMTOR cartridge. Anyone who can help please email me. Thanks,

Tom Graham N6WLF tomg@hpihoah.cup.hp.com

700. Re: was 5/8wave Question; now 1/2 wave questions

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 18:22:57 UTC
From: alanb@hpnmdla.sr.hp.com
Message-ID: <14570091@hpnmdla.sr.hp.com>
Source record: 295578

The problem with a 5/8 wave ground plane on 2 meters is that if you mount the thing on the roof of your car, you can't get it into ;the garage. So most people end up mounting the antenna on the trunk.

IMHO a quarter wave on the roof will outperform a 5/8 wave on the trunk. At the very least, it has a much more omni-directional pattern. The 1/4 wave is also cheaper and less conspicuous.

In rec.radio.amateur.misc, geraldg@oakhill.sps.mot.com (Gerald Garcia) writes:

>Are there any RF characteristic differences (loss, etc.) between full size
>RG-8/U and mini RG-8/U? I can get a better price on the mini coax (even with
>the added cost of adaptors for the PL-259 connectors), but first priority
>is performance. Thanks for the input.

I'm interested in this question, too. My understanding is that the
so-called "mini RG-8" is capable of handling high power like real RG-8,
but that it has loss characteristics more like RG-58.

True?

> si ils ont l'impression d'etre des tueurs professionels.

En tant que planque du ZeRo (je suis sur que tu parlais
de moi, entre autre, n'est ce pas ma biche ?), je me permets
de prendre la parole :

Je suis anti-militariste invertebre, et pourtant je suis
hyper-content de faire mon service national :

Je suis cooperant (ou VSNA). J'ai un job d'assistant chercheur
dans une Universite americaine, et je suis paye par
une entreprise francaise publique.

Tout le monde y trouve son compte :
Moi : J'evite d'etre trouffion de base (au passage, je compatis
avec les pov' malheureux qui sont en caserne ...)
Je suis relativement bien paye (malgre les fluctuations
du dollar, mais passons ...)
Je passe 16 mois aux States, ce qui me permet
d'apprendre les quelques mots de cette langue
sublime qu'est le ricain (je connaissais deja l'anglais !).
L'Universite : m'emploie sans me payer (tout benef').
La Cie francaise : va beneficier de mon experience acquise ici.
Le gouvernement francais : ca fait un chomeur de moins, pendant
16 mois au lieu de 12.

Conclusion : c'est un moyen intelligent de faire son service
national.
Condition requise : avoir un diplome ET (etre pistonne OU etre
perseverant OU avoir de la chance).
En ce qui me concerne, j'ai eu la chance d'etre au bon
endroit, au bon moment, c'est a dire en cours
le jour ou cet ingenieur est venu nous proposer le
poste que j'occupe actuellement. Finalement
il m'a choisi car j'avais deja fait un stage
dans cette entreprise, ce qui semblait vouloir

dire que j'etais motive par la boite ...

Voila, vous savez tout ou presque de ma vie,
Je ne vous salue pas (quelle horreur),
mais bien le bonjour chez vous quand meme,

PhE.

703. Wanted: Azden PCS-2000 (2m) documentation

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 18:59:12 UTC
From: jmn@hpfcso.FC.HP.COM
Message-ID: <103360025@hpfcso.FC.HP.COM>
Source record: 295617

I've recently managed to get my hands on a run-down

Azden PCS-2000

2m rig, and I am now in desparate need of (copies of)

schematic
operator's manual

and maybe a

service manual

if there's one to be found.

This radio is ~1978-vintage, so check the back of your file-cabinet and help me get onto VHF (cheaply!). If you have any one of these, or know someone who might, please drop me a line.

John Newman / KB0GOW
jmn@fc.hp.com

704. Re: FAQ, 2m Handhelds

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 19:45:12 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <1991Jun26.194512.8616@ux1.cso.uiuc.edu>
Source record: 295671

buckij@thor.acc.stolaf.edu (Jonathan S. Bucki) writes:

>Honest to god, I really did search for a internet site that has information
>and reviews about amateur radio equipment, especially 2M handhelds. I
>wasn't able to find one or find the the mods server that I've heard
>mentioned a couple times. Could someone please point me in the right
>direction
>
>While you're at it, is (where is) the FAQ file for this newsgroup?

I found these:

archive.cs.ruu.nl: 26089 Apr 2 09:00 FAQ/rec.radio.amateur.misc
archive.cs.ruu.nl: 36286 Apr 2 09:01 FAQ/rec.radio.shortwave
armstrong.cs.buffalo.edu: 12103 May 1 12:11 pub/ham-radio/faq1
armstrong.cs.buffalo.edu: 10151 May 1 12:11 pub/ham-radio/faq2
armstrong.cs.buffalo.edu: 12145 May 1 12:11 pub/ham-radio/faq3
sol.cs.ruu.nl: 26089 Apr 2 09:00 FAQ/rec.radio.amateur.misc
sol.cs.ruu.nl: 36286 Apr 2 09:01 FAQ/rec.radio.shortwave

I believe archive.cs.ruu.nl and sol.cs.ruu.nl are the same machine or
are using the same filesystem.

Apparently the armstrong host likes to chop things up into small files.
It's the hassle of the small files that I use FTP to get away from :-(
It is also not named with the name of the newsgroup, so people won't
find this if they search using "rec.radio.amateur".

There appears to be no standard for where FAQ's are placed. It would be
nice if some server would open up a subdirectory for all FAQ's and other
newsgroup related info files to be placed, named by the newsgroup name.

Message-ID: <1991Jun26.194941.4337@umesve.maine.edu>
Source record: 295593

Has anyone else experienced the following?
When the battery goes dead (the radio starts beeping) you only have a few seconds
in which to shut the radio off, otherwise it won't accept any input from
the keyboard, including that of the power switch. The only way to shut off
the beeping is to disconnect the battery.
I was riding on my motorcycle and the radio started beeping to indicate a failing
battery. I wasn't in a position to remove the battery from the radio, so I just
let it beep - it eventually ran completely dead and stopped beeping (of course).
Probably 10 minutes after this I removed the battery from the radio.
A half hour later, I returned to my office, and attached the radio to a power supply via
the dc in plug at the top of the radio.
It came on in the initial unconfigured state - and all my memory channels had
been wiped out. The battery had run dead previously, and I had removed it
immediately upon hearing the battery failing beeps. Upon reattaching another
battery or power supply, the radio came up and the memory channels were unaffected.
It seems that when the battery failed, it tried to use the internal lithium
battery for power, and ran that dead as well, thus wiping out my memory.
A most nasty bug....
At this point I am not sure that I might have to replace the lithium battery....
I set a couple memory channels, turned the power off, then back on, and it
didn't remember the memory channels I had just programmed in.
Comments?

To the poster with a relative in Twin Falls, ID ---

You might have your relative get in touch with Linda, N7HVF, a blind extra class in Salt Lake City --- she teaches at Handi-Hams camps and loves to help.

BTW, I think the Utah Amateur Radio Club does get either Braille or Voice recorded copies of their newsletter the "Microvolt" for their blind members.

>in Field Day trying so hard to get the complete station class
>and section from the station they were working?
>
>Anyone on the net here keep a log during FD?

Well, I think I understand this. Most of the participants in the Field Day exercise are not contest operators, and most of them likely did not understand this fine point in the rules, if they bothered to read the rules in the first place. You are correct, of course; the exchange is actually irrelevant - it is important to get the call sign correct and that is it. Standard "dupe" sheets are sufficient for reporting if the entire call signs are entered.

We had a computer for logging/duping, and the program "forced" us to enter an exchange before it would log the QSO. We were not too concerned whether we always got the class and section correct. I was asked to repeat our class and/or section numerous times. My motto is: Remember those three little words, don't argue. Keeps the stress level down B^).

2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.175 DATE: June 24, 1991
SUBJECT: Equipment for emergency responders - Part 3

Carry a note book and pencil. Keeping a log or diary of events is very important. It makes interesting reading after an event and if you must write a report it is a great help to have the dates and times of important happenings. If the incident lasts for many days, as they have in the past, the days seem to run together and to recall from memory might prove difficult. If you must handle written messages, use a different notebook for this chore. I carry a small three inch by five inch personal notebook for the diary and a regular size note book for the written messages.
Carry a small flashlight. I use the Mini-Maglite type that use double A alkaline batteries. These flashlights are very rugged and have a spare lamp in their base. If the spare lamp is needed make sure you replace it as soon as possible.
If you are on medication be sure to have an ample supply. Carry more than you think you will need.
Inform the person or persons in charge if you have a health problem and if you require special medication.
You may want to carry a camera. I carry a small 35 mm camera. It has a sliding lens cover that locks the shutter, a built in electronic flash and another feature that should prove invaluable: a clock that will stamp the day, month and year or the time of day on the negative so that it will appear on the prints.

Hi folks,

I want to be able to control an ICOM 725 from a computer, but
I don't know what codes to send down the RS-232 through ICOM's level
converter to control the rig.

Does anyone know what bytes are needed in order to set the frequency,
change modes, enquire the current rig settings, etc. are? The ICOM 725
manual does not say, and I don't have the manual for the level
converter.

>>around 9am; Field Day started at 1pm).

> I guess you guys missed the part of the rules about "The Novice/Technician
>station ... should use the call sign of one of the Novice/Techinician
>operators"

Actually, no, we didn't. The fact that the rules say "should" and not
"must", and the fact that the club call doesn't really have a class
associated with it, we figured W9YH was effectively a Novice call when
being operated by Novices.

Anyway, we asked Drew, K9CW, who is a FD veteran, and he seemed to
think it was fine.

By the way, the consensus seems to be that "UR" indeed does stand for
"you are" and thus really isn't conveying its usual meaning as such,
but in any other contest you'd say "UR 599", so at field day I guess
"UR 5A IL" is just natural.

Finally, about copying reports when they weren't specifically required,
I dunno, I just felt kind of guilty when I copied a callsign, went
back, heard him call me back, but then couldn't copy anything else.
Doesn't really seem like communication to me. Maybe I don't have the
true spirit of contesting. :) As our club advisor, KA6A, told us,
"You guys did a great job because you had fun."

I have a question in a similar vein.

My club's Field Day station uses some homebrew software. While it works, it has some shortcomings. I'm looking for a PC program that can be linked to another PC or terminal, allowing multiple transmitters to log without working the others' contacts. A forms-based or MS-Windows UI would be nice.

For now, we've designated one station as "voice" and the other "CW" to avoid having to network our loggers. CW is where the points are, so it would be nice if the program would warn you that another transmitter is on 15m CW. Self-induced QRM is the pits. How do those 24A stations do it ?

>Thats one story I don't think anyone can beat.

The only thing that happened to our club station (W0DZ) was a one-hour QRT due to lightning and 1" hail. The wind rotated the novice station's reflector a bit, but it didn't discourage the intrepid souls there. Being on a ridge at 500' above average terrain can be a little frightening.

10 and 15 didn't really come up until Sun am. We must have worked everyone on 20 Sat nite, because 40 was noisy with all the tstorms. I definitely remember logging W6OTX.

Perry / AA0ET

719. Re: Question on 5/8 antennas...

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-26 22:30:02 UTC
From: whester@isis.cs.du.edu
Message-ID: <1991Jun26.223002.25126@mnemosyne.cs.du.edu>
Source record: 295589

Hmmm, this question of antenna type affecting audio quality is beginning to sound like the debate on "Monster Cable" in stereo systems...

But you know, I've found that the 5/8 does give cleaner, more transparent, sibilants than does the 1/4 or 1/2 wave...must have to do with the time domain phase inversion group delay as the sound goes through the matching coil at the base. Of course this can't really work unless the new age crystal energy field is in resonance with the cycle of the moon.

Hmmm, this will require more study...

:-)

Where I live, at the base of some mountains, I have found that many times a plain old 1/4 wave mounted on top of the car outperforms the 5/8 wave. This is because the 2 meter repeaters in this area are on top of the mountains and some upwards radiation actually helps to get in to them... especially when traveling up the canyons in the mountains. At that point, I don't care much about the audio quality -- just want to be heard.

Diana L. Syriac reply ref the Army not teaching Morse code---
I believe you missed the point. I am an x o5H who learned morese
code at Ft. Devens. They still teach morse code but its receive only.
The 31C course taught at Ft. Gordon does not teach morse Unless there
is a command directed need. There is talk afoot about returning to
teaching Some People morse if after they go to an assignment it is
determined to be necessary. I have not seen the course dates but there
was a msg sent to me about the course being considered. ALL of my
MARS/HF operators WILL attend as soon as I can get them there. The Army
DOES still us Morse code. Both service connect and MARS nets. Altho
the MARS code nets that I have participated in (not very often by the way)
are not running people off because thay have too many participants.
Excuse the typing - they pay me to make things happen not to spell. HI HI

Tadd, two points...

A)The rules state:
6)Exchange: Stations in any ARRl/CRRL section will exchange their
field day operating class and ARRL/CRRL section.

B)The rules state that home stations (class d) may contact only class a,b,c,
and e stations for points. Now, it would be difficult to determine what
your score was if you didnt exchange the info.

I dont see anything that requires me to keep a log (I did however), but
I feel its clear that I must EXCHANGE the info for a valid contact....

Just for kicks, why dont you include a cover letter saying that you didnt
exchange the info with your entry, then tell us what the ARRL decides...

Here in New South Wales, the sale and use of radar detectors has been illegal since the beginning of the year, and other Australian states are expected to follow soon. Apparently the boys in blue have radar detector-detectors, which presumably pick up the local oscillator radiation. Just how a state government can ban the use of passive reception devices I don't know, but nobody has challenged the legislation to my knowledge.

I suppose the whole thing will become academic anyway if those optical guns take off. Just how do they work anyway - I'd have thought the doppler shift at those frequencies would be undetectable at car-type speeds, or do they modulate teh beam in some way?

This year during field day our station suffered severely from cross interference whenever we put both the SSB and the CW station on the same band. In essence, we couldn't have both on the same band at the same time. For 10/15/20, we had a Butternut Bow-Tie and a Cushcraft A3, both up about 50 feet, separated approx-imately 80 feet. On 40, we had 2 quarter wave monoband verticals spaced a good 50 yards apart. The same results held on all bands--and these were not low end rigs. The SSB rig was an ICOM 781, and it was getting swamped by the CW stations's 100 watts. I know this is an old problem for multi-multi contest stations and that it's easily solvable. I just never paid attention in the past when I heard this being discussed because I never pictured myself setting up a multi-multi station. Now that we suffered for that ignorance, it would be nice to know for next year. Just how do the big guys isolate multiple rigs on the same band in close proximity to each other?

As in the past few years, the Honolulu Amateur Radio Club (KH6WO) operated field day '91 from Kualoa Beach Park on the windward side of Oahu. The setting up, operating, eating, eyeball qso's etc. were all as before but a new twist was added this year. At about 10 pm NH6KW whipped out his ukulele and some song sheets and conducted a sing-along till almost 1 am. Needless to say, all had a GREAT time.....especially the XYL's and other non-operators.
Guess he created a new tradition for KH6WO field day....Next year when you work us, Listen up....you might hear 'Lahainaluna' or 'Tiny Bubbles'!!!!

727. FAQ for Amateur Radio - Part 1 of 4

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 11:51:11 UTC
From: dls@genrad.com
Message-ID: <42079@genrad.UUCP>
Source record: 295601

Since I'll be gone next week, I'm publishing this a few days early. CHEERS!
Diana

| 25-Jun-91 10:10 dls update, see changebars (|)
The following is a monthly posting of frequently asked questions for
Amateur Radio. Due to the increasing size of this list, I've broken it into
4 Parts (and will break it further if necessary) to keep each Part under
10K bytes.
Part 1 - Beginning Amateur Radio questions
Part 2 - "Where can I find ..." computer questions
Part 3 - Amateur Radio Organizations and Publications
Part 4 - Common Advanced and Technical questions
If you have any questions you think should be added, please email to me at
dls@genrad.com.
This FAQ should ONLY be reposted once a month. If someone asks a question
that is answered by this FAQ, I suggest emailing to that person, or,
alternately, post only the section that answers the question, NOT the entire
|FAQ posting. Read news.announce.newusers for proper net etiquette.

FREQUENTLY ASKED QUESTIONS
Part 1 - Beginning Amateur Radio questions

Table of Contents:
** What is Amateur Radio?
** Who can become a ham in the United States?
** OK, so how do I become a ham in the United States?
** Where can I locate information and books on Amateur Radio?
** How much does it cost?
** Where can I take the tests?
** What are the tests like?
** What can I do with a ham radio license?
** What can't I do with an Amateur Radio license?
** I'm interested, who will help me?
** Should I build my own equipment?
** Should I build my own antenna?
** Do I need a huge antenna and tower like my neighbor?
** Where do I buy equipment?
** I've only got one 'meter' on the front of my radio - does this mean
it's a 'one meter' radio? (Wow - some guys have 80 of 'em??? :-)

** What is Amateur Radio?
Amateur Radio is a non-commercial radio communication service
whose primary aim is public service and communication between
private persons. Amateur Radio operators are commonly called
hams. It's great fun to talk to someone in Japan on the radio!

Here's one ham's description of Amateur Radio: "Climbing towers, roofs, trees, or any other fixed object to hang antennas. Restoring ancient equipment to operation. Playing with glitzy new equipment. Blowing up finals. Cutting holes in your (or your buddie's) car. Building your own stuff. Wiping out your neighbor's TV and then having to explain and fix it. The joy and magic of communicating with someone half way around the world with a few bits of glass and wire."

** Who can become a ham in the United States?
Anyone who is not a representative of a foreign government can be an Amateur Radio operator in the USA. There are tests that you must pass to get a license, however the tests are not insurmountable. There are 7-year-old hams and 80-year-old hams. There are many handicapped hams who get great enjoyment out of Amateur Radio.

** OK, so how do I become a ham in the United States?
There are now two entry-level class licenses in Amateur Radio. A Novice license requires passing a 30-question written test and a Morse code test given at 5 words per minute. A Technician license requires passing the 30-question written Novice test and a 25-question written Technician test, but no Morse code test. See local radio clubs or radio stores in your area for more information. Note that you can get a higher class license instead, simply by passing the required tests.

** Where can I locate information and books on Amateur Radio?
Your local Radio Shack sells some ham radios and Amateur Radio license books. Books can also be obtained through the mail from ham radio organizations, such as ARRL in Newington, CT (203-666-1541) and W5YI in Dallas, TX (1-800-669-9594). There may be one or two ham radio stores in the local area (ie, within 50 miles). Try looking in the Yellow Pages under Radio Communications. Be assured that once you get a callsign, the mail order ham radio companies will find you :-).
For the Novice license, get a Novice License manual, plus 5-word-per-minute Morse code tapes, costing around $25. For the Technician license, get a Novice License manual, a Technician License manual, and an FCC Rules manual, costing around $32. The FCC Rules manual is a good idea for Novice also, but not necessary, since the Novice License manual contains all the FCC Rules that are required for the Novice License.

** How much does it cost?
To take the Novice tests, it's free. To take the Technician or higher class tests, there is a small charge (around $5 currently) to cover copying costs and running the testing sessions. The cost of a radio is really dependent on what you want to do. You can make your own radio and antenna for under $150. You can buy a used single-band radio for $150-$300. Or you can buy a new multi-band

multi-mode radio with all the doodads for $300-$3000. I'd suggest you learn more about ham radio, talk to local hams, find out what you want to do with ham radio first.

** Where can I take the tests?
The Novice tests can be given by any two qualified hams of General class license or above. The Technician tests and all higher class license tests are given by three qualified Volunteer Examiners (VEs) who volunteer their time.

** What are the tests like?
Each of the written tests (Novice, Technician, General, Advanced, and Extra) are generally a multiple choice test of approximately one-tenth of the question pool. For example, if the question pool is approximately 300 questions, then the test will be a 30-question test. You need to get 75% correct to pass. Note that they truncate to determine the correct number of questions. That means for a 30 question test, you need to get 22 right, which is actually only 73.3%.

Once you've paid the small fee for Technician-Extra tests, it costs no extra to take another test, so I'd suggest you keep taking the next more advanced test until you fail. If you pass the written but not the Morse code (or vice versa) for a specific class license, you have up to one year to take the other test before you would have to retake the written test again. Note that some VEs will not allow you to take the written test unless you've first taken the Morse code test.

The Morse code test is a receiving test only. The test run 5 to 7 minutes. After the test, you are given a 10-question multiple-choice or fill-in-the-blank test. Passing grade is 7 or more. If you fail the 10-question test, the examiner team will examine your copy sheet to see if you have 1 minute of solid copy with no errors. For 5 wpm, that's 25 characters, for 13 wpm, that's 65 characters, for 20 wpm, that's 100 characters. If they can find 1 minute solid copy, you've still passed.

Hints on Morse code tests: Generally, it will be a standard QSO (conversation), and it MUST contain at least one of each of the following:
26 letters A-Z, 10 numbers 0-9, comma (,), period (.), slant or slash (/), question mark (?), double dash prosign (BT), end of message prosign (AR), end of contact prosign (SK).
The letters count as one character, all others count as two characters. There are a couple other prosigns which are worth knowing, but will not be on the test, like "I'm done talking, next" is K, "I'm done talking, back to you" is KN, "Please wait" is AS.

** What can I do with a ham radio license?
There are so many things, it's a difficult question to answer, but here's some ideas:
* Talk to people in foreign countries.

* Talk to people (both local and far away) on your drive to work.
* Help in emergencies by providing communications.
* Provide communications in parades or walkathons.
* Help other people become hams.
* Hook your computer to your radio and communicate by computers.
* Collect QSL cards (cards from other hams) from all over the
United States and foreign countries and receive awards.
* Participate in contests or Field Day events.
* Provide radio services to your local Civil Defense organization
thru ARES (Amateur Radio Emergency Service) or RACES (Radio Amateur
Civil Emergency Service).
* Aid members of the US military by joining MARS (Military Affiliate
Radio System).
* Have someone to talk to on those sleepless nights at home.
* Receive weather pictures via satellites.
* Build radios, antennas, learn some elctronics and radio theory.
* Talk to astronauts in space, or use the moon to bounce signals
back to people on the Earth.
* Experiment with Amateur TV (SSTV) or send still-frame pictures
by facsimile.
* Experiment with amateur satellite communications.

** What can't I do with an Amateur Radio license?
The most important thing you can't do is transact business of any
kind over ham radio. Interference to other hams or services, as
well as obscene, profane or indecent language is not tolerated and
is illegal. Music and broadcasting are not allowed on ham radio.
Some personal conversations may not be appropriate to Amateur Radio.
Do you really want the whole world to hear about Aunt Mabel's
hemorrhoids?

** I'm interested, who will help me?
There are hams who are willing to become "Elmers" (mentors, helpers)
in your local area. Look around and ask local hams. Search out
local radio clubs. As well, some people have volunteered to be
an Elmer over the Usenet. Paul has volunteered to maintain that
list. If anyone wants to be an Elmer, or needs an Elmer, email him:
Paul W. Schleck, KD3FU, acmnews@zeus.unomaha.edu

** Should I build my own equipment?
"Homebrewing" is a fun and educational part of ham radio. It is a
thrill to build your own transmitter and put it on the air. However,
building your own receiver can be quite complicated; if you don't have
electronics experience, you may want to buy a receiver instead. Most
homebrew transmitters are QRP (transmit very low power). That's fine
for an experienced ham with a very good antenna, but a Novice ham will
just get frustrated. Your first rig, therefore should NOT be a home-
brew.

** Should I build my own antenna?
Most hams build their own antennas for base station use and buy

antennas for mobile (car) use. Most beginner ham books describe how to build different types of antennas. Order of difficulty, from easiest to more difficult, for some common antennas are: wire dipole, Zepp, Yagi, Quad.

** Do I need a huge antenna and tower like my neighbor?
No! Large beam antennas and 40-foot towers are very expensive. As a beginner, a simple dipole antenna is perfectly adequate. As you gain experience (and money :-), you may want to invest in something bigger.

** Where do I buy equipment?
If you can afford new rigs, there are many mail order stores that advertise in ham radio magazines. If you want to buy a used rig, the best place is at a "hamfest" (ham flea market). You should take along an experienced ham, since some of the used equipment may be inoperative, overpriced or poor quality. You can also answer ads in ham magazines or posted at ham radio stores, although often, by the time you call, the equipment has already been sold.

** I've only got one 'meter' on the front of my radio - does this mean it's a 'one meter' radio? (Wow - some guys have 80 of 'em??? :-)
Meter refers to the wavelength of the signal at which you are transmitting. There is a inverse relationship between the frequency (specified in kilohertz or megahertz) and the wavelength (specified in meters or centimeters).

728. FAQ for Amateur Radio - Part 2 of 4

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 11:52:06 UTC
From: dls@genrad.com
Message-ID: <42080@genrad.UUCP>
Source record: 295600

| 27-Jun-91 07:40 dls update, see changebars (|)
The following is a monthly posting of frequently asked questions for
Amateur Radio. Due to the increasing size of this list, I've broken it into
4 Parts (and will break it further if necessary) to keep each Part under
10K bytes.
Part 1 - Beginning Amateur Radio questions
Part 2 - "Where can I find ..." computer questions
Part 3 - Amateur Radio Organizations and Publications
Part 4 - Common Advanced and Technical questions
If you have any questions you think should be added, please email to me at
dls@genrad.com.
This FAQ should ONLY be reposted once a month. If someone asks a question
that is answered by this FAQ, I suggest emailing to that person, or,
alternately, post only the section that answers the question, NOT the entire
FAQ posting. Read news.announce.newusers for proper net etiquette.

FREQUENTLY ASKED QUESTIONS
Part 2 - "Where can I find ..." computer questions

Table of Contents:
|** I don't have a news server at my site, how can I subscribe to the
rec.radio.amateur groups?
** I can read news at my site, but I don't have posting privileges. How
can I post?
|** I don't have FTP capability at my site. Can I get files via email?
|** Where can I find ftp sites that have ham-related files?
** Are there any Telephone BBS's which have ham related files?
** Are there Dialup News services for Amateur Radio?
|** Are there any on-line callbooks?
|** Where can I find modifications for my radio to extend its capabilities?

** I don't have a news server at my site, how can I subscribe to the
** rec.radio.amateur groups?
To subscribe to rec.radio.amateur.misc, send email to:

Info-Hams-Request@ucsd.edu

In the body of the message, write:

subscribe Info-Hams

Similarly, to subscribe to rec.radio.amateur.packet, send email to
Packet-Radio-Request@ucsd.edu, message is "subscribe Packet-Radio",
and to subscribe to rec.radio.amateur.policy, send email to
Ham-Policy-Request@ucsd.edu, message is "subscribe Ham-Policy", and
to subscribe to rec.radio.shortwave, send email to

| listserv@cuvma.columbia.edu, message is "subscribe swl-l (your name)".
To unsubscribe, follow directions above, changing the command word
"subscribe" to "unsubscribe". Help is available by using the command
word "help". Note that command words MUST be the first word on each
line of the message.

** I can read news at my site, but I don't have posting privileges. How
** can I post?
You can post to rec.radio.amateur.{misc,packet,policy}
by sending your posting email to Info-Hams, Packet-Radio, or
Ham-Policy, all at ucsd.edu. To post to other newsgroups, send the
posting email to (groupname)@ucbvax.berkeley.edu and for the
groupname, replace periods with dashes.
For example, to post to sci.space, you would send your posting to
sci-space@ucbvax.berkeley.edu.
All of the Amateur radio newgroups are archived on ucsd.edu under
subdirectory mailarchives/{Ham-Policy,Info-Hams,Packet-Radio}.

** I don't have FTP capability at my site. Can I get files via email?
| ANY BITNET, EARN, or NorthNET site can access the Princeton mail
| server. It will be most efficient if you know the complete path
| and filename for an;ything you wish to transfer, but you can use
| 'cd' and 'ls -l' commands to move about and browse the remote site's
| directories. Remember, though, that each request to the BITFTP
| server may take several hours (or longer) to be fulfilled.

| For access to the FTP server, send email to bitftp@pucc.bitnet (for
| BITNET, EARN and NorthNET users ONLY!). Subject doesn't matter.
The text of the email is the FTP commands one after another. For
example, suppose you wanted to access the FTP site lcs.mit.edu:
FTP lcs.mit.edu
USER anonymous
PASS yourname@yoursite (not required)
ASCII
CD telecom-archives
GET filenames
BYE
A help file is available giving detailed instructions by putting
the single word HELP into the text of the email.

| For nonBITNET users, there is also a FTPMAIL server at
ftpmail@decwrl.dec.com. Commands include: REPLY <mailaddr>,
| CONNECT [HOST [user [pass]]], ASCII, BINARY, COMPRESS, COMPACT,
| UUENCODE, BTOA, LS <directory>, DIR <directory>, GET <file>, QUIT,
HELP. Get the help file for more information by sending mail with
| the single line "help". The ftpmail site may complain if you try
| try to get more than 1 file per email request. Here is an example
| of a request:
| reply your_name@your_site
| connect uxc.cso.uiuc.edu
| binary

| uuencode
| get pub/ham-radio/Tech.v3.3.sit.hqx.Z
| quit

| A note on the use of FTP mailservers: If you want to use FTP
| mailservers, like FTPMAIL, please be considerate of any systems that
| your mail must pass through. The quickest way to find yourself cut
| off from the world is to make the admins of sites that pass your mail
| pass 60Mb of X11 graphics system source. If you need large amounts
| of information from a mailserver, contact your admin for help -- it
| may already be available, or he may know a better way to get it.

** Where can I find ftp sites that have ham-related files?
| There is a fairly definitive list of anonymous FTP sites available
| from pilot.njin.net under subdirectory /pub/ftp-list in file ftp.list.
You can also have the latest copy (published monthly) via mailing
list by emailing to odin@pilot.njin.net, subject "listserv-request",
body of message "send help". Revision info for the ftp list should
be send to odin@pilot.njin.net.

General files for any computer and informational archive:
ftp.cs.buffalo.edu (submissions to this ftp site should be made to
| bowen@cs.buffalo.edu) - contains many ham radio files,
| including the FAQs, Elmer list, SWL and scanner info and
| the KA2UGQ worldwide BBS list on ~pub/ham-radio/phone_bbs_list
| freja.diku.dk - mirror image of ~pub/ham-radio on ftp.cs.buffalo.edu,
| for access by Northwestern European countries only (server is
| in Denmark)
wsmr-simtel20.army.mil (submissions to this ftp site should be made
| to w8sdz@wsmr-simtel20.army.mil) or wuarchive.wustl.edu (ONLY
| BITNET users!) - these are mirror images of each other - These
contain ham radio mods and ham radio software
| A wide assortment of files covering many topics can be
| obtained from the SIMTEL archives. If you cannot directly FTP
| from wsmr-simtel20, there is a mail server that can help.
| Send mail with the text "help" to listserv@vm.ecs.rpi.edu.
| quiche.cs.mcgill.ca (comments to archie-l@cs.mcgill.ca) - contains
| ham related software on /pub/ham-radio and /hamradio, including
| the FAQs, Elmer lists and geoclk (try the command 'prog geoclk'
| to find all files whose name contains "geoclk")

MacIntosh computer:
ftp uxc.cso.uiuc.edu, log in as "anonymous", password is your email
address, cd pub/ham-radio - This contains the HyperCard
| Hamstacks written by Diana Syriac as well as ASCII readable
| ham radio question pools
apple.com, cd pub/ham-radio - Ham software and information, especially
MacIntosh software

Amiga computers:
ab20.larc.nasa.gov - don't know if there are any ham files here.

** Are there any Telephone BBS's which have ham related files?
WB3FFV has one, phone is 301-625-0817 for 1200 and 2400 baud modems.
This also supports UUCP. Login is uucpanon, no password. For a
listing of available archived, try:
uucp wb3ffv!~/FILES /usr/spool/uucppublic

** Are there Dialup News services for Amateur Radio?
There are two major news services for ham radio. Both are run by
volunteer hams and provide bulletins of specific interest to amateurs,
hence they are perfectly legal to rebroadcast on ham bands according
to FCC Regulation 97.111B(6). To lessen the load on the dialup lines,
consider getting your local repeater operator to rebroadcast it, or
tape record it to play at your favorite HF net.

RAIN (Radio Amateur Information Network) is produced by Hap Holly,
KC9RP, located in Illinois. The news is typically updated 8am CST
Fridays. Phone numbers are 1-708-299-INFO (299-4636) and
1-708-827-RAIN (827-7246).

NEWSLINE is another, produced by Bill Pasternak, WA6ITF. Donations
for NEWSLINE are accepted at Newsline Support Fund, c/o Dr. Norm
Chalfin K6PGX, Pasadena, CA 91102. Phone numbers are:
Chicago 1-708-289-0423
N.Florida 1-407-259-4479
Los Angeles 1-805-296-2407

** Are there any on-line callbooks?
If you are at an Internet site you can connect using telnet to one
of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.4)
ham.njit.edu (currently 128.235.1.10) (alias plan9.njit.edu)

The servers sit on port number 2000 which is a different port number
than what telnet usually defaults to. So if you just telnet to these
machines, you will get a login prompt instead of the server. How you
tell your telnet program to connect to port 2000 instead of the
default port is operating system dependent but it is usually done
with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, consult your local systems guru for the proper
command string.

The interactive servers are designed to be somewhat self-explanatory
and they support fairly detailed help facilities. The first command
you should execute when connecting to one of these servers is "info".
This will list general info about that server and how to use it. You
should then type "help" to list the various commands available.
Typing "help" followed by a command name will give you a little more
detail about that command. Servers allow searches by call, last name,
zip code or city and also provide regular expression filters to trim
your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty Carruth, N7IKQ. This database currently contains US and Canadian callsigns and it does not contain club calls. A new version of the database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com | (The UUCP address is ...!uunet!dptspd!callbook). In the body of the text, say "lookup" followed by callsigns you want to look up. If your mailer appends signature files, you should put a line "quit" at the end of your request (before the signature file). If you want help, put the word "help" on a line by itself. Here is what a request might look like:

```
help
lookup kc1sp wn4bbj
lookup n0fzd
quit
```

If you are a packet radio station, callserver data is available from REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns, separated by spaces. Body of message is ignored. The server is an OS interface to the MBL packet BBS using the Buckmaster CD-ROM callsign database.

** Where can I find modifications for my radio to extend its capabilities?
There are two ftp servers that has this data:
| wsmr-simtel20.army.mil or wuarchive.wustl.edu (BITNET ONLY)
Another FTP site to try is 129.100.22.100.

| There is a new server at pcserver@novell.business.uwo.ca. In the body of the email, send the command HELP.

There is a packet radio Mods Server. To get the directories, send a packet as follows:

```
SP REQFIL@N2IMC.NJ.USA.NA
Subject: MODS\Dir.1
/EX
```

To get the mod, send to same place, with Subject MODS\Filename.ext.

REMEMBER that any modification is likely to void your warrantee and that these mods are NOT guaranteed to work.

```
| 27-Jun-91 07:46 dls update, see changebars (|)
The following is a monthly posting of frequently asked questions for
Amateur Radio. Due to the increasing size of this list, I've broken it into
4 Parts (and will break it further if necessary) to keep each Part under
10K bytes.
Part 1 - Beginning Amateur Radio questions
Part 2 - "Where can I find ..." computer questions
Part 3 - Amateur Radio Organizations and Publications
Part 4 - Common Advanced and Technical questions
If you have any questions you think should be added, please email to me at
dls@genrad.com.
This FAQ should ONLY be reposted once a month. If someone asks a question
that is answered by this FAQ, I suggest emailing to that person, or,
alternately, post only the section that answers the question, NOT the entire
|FAQ posting. Read news.announce.newusers for proper net etiquette.

FREQUENTLY ASKED QUESTIONS
Part 3 - Amateur Radio Organizations and Publications

Table of Contents:
** Where can I find VE sessions in my local area?
** How do I use the incoming and outgoing QSL bureau?
** Are there any news groups for CAP?
** What's the name of the QRP club that issues QRP numbers?
|** Can I send ARRL electronic mail?
|** What magazines are available for Ham Radio?
|** How do I join MARS?
** How do I join RACES?
** What organizations are available to help handicapped hams?
** Is there any information on antique radios?
** I am looking for a specific ham, can anyone help me find him?
** Is there an on-line copy of the FCC Part 97, or FCC Amateur Radio
allocations?
|** Can I post my neat new ham related program on rec.radio.amateur.misc?
------------------------------------------------------------------------------
** Where can I find VE sessions in my local area?
VE sessions are often announced in the local newspapers, but more
often, they are announced by local radio bulletin boards. The
local packet BBS will most likely have a monthly updated schedule
for VE sessions. ARRL or W5YI can generally be called and asked for
local VE sessions as well. Don't forget that you will need the
following when you go in for an upgrade: a copy of your current
Amateur license; your original Amateur license; any CSCEs (duplicate
not required), if applicable and less than a year old; a picture ID,
preferably a driver's license, passport or visa; and the VE test
```

fee (approximately $5 right now).

** How do I use the incoming and outgoing QSL bureau?
To use the outgoing QSL bureau, you must be a member of ARRL. In general, you send a bundle of foreign (not States!) QSL cards to the outgoing bureau in Newington, Connecticut, along with a label off of your QST magazine (which shows ARRL membership), along with $2 per pound of cards (approximately 150 cards) or $1 for 10 cards or less.

To use the incoming QSL bureau, you do NOT have to be a member of ARRL. Send one or more Self-Addressed Stamped Envelopes (size 5x7 or 6x9, no bigger, no smaller) with one ounce of postage attached and with your callsign in 3/4" letters in top left hand corner where the return address label would go. If you expect a large quantity of foreign QSL cards, attach extra money or postage with a paper clip. Send the envelopes to the QSL bureau for your callsign area. If your callsign is xx3xxx/5, you would send it to the 3rd call area, NOT the 5th call area. Addresses for QSL bureaus are listed in QST; if you don't have access to a QST magazine, ask another ham. IMPORTANT: BE PATIENT! Turnaround time for a US QSL bureau, not considering foreign QSL bureaus, is about 3 months. Foreign QSL bureaus and hams can be as fast as 2 months or as slow as TEN YEARS, while average is about 6-12 months.

** Are there any news groups for CAP?
There is no news group just for Civil Air Patrol discussions. However, rec.aviation is appropriate for CAP aviation discussions and for CAP radio information, these rec.radio.amateur.* groups are available. In addition, there is a mail digest just for CAP. Subscribe by emailing to capital-request@cps.udayton.edu. Submit articles by emailing to capital@cps.udayton.edu. CAP related files are also stored on the FTP site sunburn.cps.udayton.edu in pub/capital.

** What's the name of the QRP club that issues QRP numbers?
QRP Amateur Radio Club International, c/o Bill Harding K4AHK, 10923 Carters Oak Way, Burke, VA 22015.

** Can I send ARRL electronic mail?
Several ARRL HQ staffers can be contacted via the net, using the address username%arrlhq.UUCP@uhasun.hartford.edu, replace username as shown below:
Jon Bloom, KE3Z, Laboratory Supervisor jbloom
Tammy Bosco, Technical Secretary tbosco
Ed Hare, KA1CV, Laboratory Engineer ehare
Rus Healy, NJ2L, QST Asst Tech Ed, Product Rev rhealy
Dave Newkirk, WJ1Z, QST Asst Tech Ed, Hints dnewkirk
Paul Pagel, N1FB, QST Asst Tech Ed, Tech Corres ppagel
Mark Wilson, AA2Z, QST Managing Editor mwilson
Technical Information Service, tech questions tis

For other questions (VE program, Field Organization matters, ARRL
| policy issues, etc.), try 2155052@mcimail.com, which sends them to
the front office.

** What magazines are available for Ham Radio?
Your local ham store may have some, but here's some popular ones
(this is NOT a complete list!):
QST, ARRL, 225 Main St, Newington, CT 06111 - basic projects and
contesting
CQ The Radio Amateur's Journal, 76 North Broadway, Hicksville, NY
11801 - beginner ham radio articles
73 Amateur Radio Today, WGE Center, Forect Rd, Hancock, NH 03449,
| FAX (603) 525-4423, email: COMPUSERVE 70310,775 or Internet
| 70310.775@compuserve.com - more technical ham radio articles
QEX, ARRL, 225 Main St, Newington, CT 06111 - more technical projects
WorldRadio, 2120 28th St, Sacramento, CA 95818, (916) 457-3655.
Subscriptions to 201 Latrhop Way, Ste D, Cacramento, CA 95815,
(800) 365-SUBS - lots of special interst columns, like QRP,
ATV, YL, etc.
W5YI Report, PO Box 565101, Dallas, TX 75356, 1-800-669-9594 -
up-to-date information on Amateur Radio happenings, including
VE information and statistics

** How do I join MARS?
To join MARS, you have to be 14 years or older (parental consent
required under age 17), be a US citizen or resident alien, possess a
valid Amateur Radio license, possess a station capable of operating
on MARS HF frequencies, and be able to operate the minimum amount
of time for each quarter (12 hours for Army and Air Force; 18 hours
for Navy-Marines). Novices must upgrade to Technician within 6
| months, else be dropped from MARS. No-Code Techs can apply, provided
| they have transmit and receive HF capability for MARS frequencies
| (they don't need transmit capability for Amateur HF frequencies). For
application forms contact:

Chief, Air Force MARS
TIC/DLTXM
Scott AFB, ILL 62225-6001
(618) 256-5552. Or, contact via Internet goes to
__daniels@server.af.mil, put "Pass to MSgt Trimmer" in subject line.

Chief, Army MARS
HQ, US Army Information Systems Command
ATTN: AS-OPS-OA
Fort Huachuca, AZ 85613-5000

Chief, Navy-Marine Corps MARS
Naval Communication Unit
Washington, DC 20397-5161

** How do I join RACES?
Contact your nearest Civil Defense or Emergency Management Agency.
The Radio Amateur Civil Emergency Service is a part of a municipal,

county, or state government. This does not mean, however, that
every such government has a RACES program. If your government does
not have a RACES, ask them to refer you to the nearest jurisdiction
that does have a RACES program.

** What organizations are available to help handicapped hams?
Courage Center
Handihams
2915 Golden Valley Rd
Golden Valley, MN 55422
(612) 520-0515
ARRL has a Handihams information package (get it by requesting it
thru 2155052@mcimail.com) and a book called "The ARRL Plan for the
Disabled", available at no charge from the ARRL Regulatory
Information Branch.

** Is there any information on antique radios?
Antique radio classifieds: ARC, PO Box 802-B6, Carlisle, MA 01741 -
old radios, TVs, ham equipment, 40s and 50s radios,
telegraph, books, etc.
Hallicrafter Service manuals: Ardco Electronics, PO Box 95, Dept Q,
Berwyn, IL 60402
Antique Wireless Association, Bruce Kelley, W2ICE, Route 3, Holcomb,
NY 14469 - sponsors the Wireless Museum

** I am looking for a specific ham, can anyone help me find him?
Rather than sending out a message on Usenet, you might first try
directory assistance from the phone company or the locator service
provided by the Salvation Army. A Salvation Army post in your
local area may be able to help you. If you have his/her callsign
or name, you might also try one of the on-line callservers shown
above.

** Is there an on-line copy of the FCC Part 97, or FCC Amateur Radio
** allocations?
Part 97 is available by ftp from wuarchive.wustl.edu, file is
mirrors/misc/hamradio/part97.txt.

** Can I post my neat new ham related program on rec.radio.amateur.misc?
This is really not a good idea, since many of the readers receive
| these newsgroups as mail digests. Posting is also a one-shot thing.
| If you post and someone missed it, it is gone. A better way would be
to announce the existence of your program here, along with
| information on how to obtain a copy of your program. You can also
| submit it to one of the FTP archive sites, which will allow the world
| to access it without you having to mail it to each requestor. If you
just GOTTA post it somewhere, post it to more appropriate groups,
like comp.sources.unix or alt.sources or comp.binaries.pc.

730. FAQ for Amateur Radio - Part 4 of 4

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 11:53:39 UTC
From: dls@genrad.com
Message-ID: <42082@genrad.UUCP>
Source record: 295599

```
| 25-Jun-91 10:13 dls update, see changebars (|)
The following is a monthly posting of frequently asked questions for
Amateur Radio. Due to the increasing size of this list, I've broken it into
4 Parts (and will break it further if necessary) to keep each Part under
10K bytes.
Part 1 - Beginning Amateur Radio questions
Part 2 - "Where can I find ..." computer questions
Part 3 - Amateur Radio Organizations and Publications
Part 4 - Common Advanced and Technical questions
If you have any questions you think should be added, please email to me at
dls@genrad.com.
This FAQ should ONLY be reposted once a month. If someone asks a question
that is answered by this FAQ, I suggest emailing to that person, or,
alternately, post only the section that answers the question, NOT the entire
|FAQ posting. Read news.announce.newusers for proper net etiquette.

FREQUENTLY ASKED QUESTIONS
Part 4 - Common Advanced and Technical questions

Table of Contents:
** What are the different US amateur classes and what can each of them do?
** I'm confused. What do all those abbreviations mean???
** What do all those "tones" mean?
** Where can I learn more about Amateur Radio if I live outside the USA?
** How can I get a "reciprocal license" if I am a licensed ham from another
country?
** My apartment complex does not allow outdoor antennas, now what do I do?
** I got TVI...HELP!!!
** What do you need to get started in packet radio?
** What do I need to get started in satellite communications?
** Did you know that you can get college credit for being a ham?
|** On what frequencies does JPL and GSFC retransmit the shuttle audio?
------------------------------------------------------------------------------
** What are the different US amateur classes and what can each of them do?
Novice - has CW (Morse code) privileges on 4 HF bands (80, 40, 15,
and 10 meter), Voice priveleges on 10 meters, and full priveleges
on 2 VHF/UHF bands (220 MHz and 1290 MHz).
Required are 5 wpm Morse code test and 30-question Novice test.
Technician - has full priveleges on all VHF/UHF bands above 30 MHz.
Required are Novice test and 25-question Tech test.
Technician may access Novice HF bands by passing the 5 wpm Morse
code test.
General - has all Technician priveleges, plus larger access to more
HF bands, including CW and Voice on 160, 80, 40, 30, 20, 17, 15,
12, and 10 meter bands. A General class amateur can give Novice
```

tests.
Required are 13 wpm Morse code test, Novice, Tech and 25-question
General test.
Advanced - has all General priveleges, plus wider band access on 80,
40, 20, and 15 meter bands. An Advanced class amateur can
also become a VE and give tests to Novice and Tech tests.
Required are 13 wpm Morse code test, Novice, Tech, General and
50-question Advanced test. The Advanced test is the most difficult
of the five written tests.
Amateur Extra - has full privileges on all amateur bands. An Extra
can become a VE and give all amateur tests.
Required are 20 wpm Morse code test, Novice, Tech, General,
Advanced and 40-question Extra test.

** I'm confused. What do all those abbreviations mean???
AM Amplitude Modulation
AMTOR Amateur Teleprinter Over Radio. A more sophisticated version
of RTTY. Also used commercially as SITOR (Simplex Teleprinter
Over Radio).
ATV Amateur Television - a way to see who you're talking to!
CAP Civil Air Patrol is a volunteer organization that searches for
downed aircraft and missing kids and uses frequencies just
outside of the ham bands and often uses modified Amateur radios
CB Citizen's Band radio, this is NOT part of Amateur Radio and
does not require any license to operate
CQ An on-the-air request for a conversation with anyone
FM Frequency Modulation
FieldDay A June activity to practice emergency communications for
24 hours....wives call it 'an exercise in male bonding' :-).
HF High Frequency - 3 MHz to 30 MHz
HT Handy-Talky, a shorthand for "hand held radio"
LF Low Frequency - 30 kHz to 3 MHz
MARS Military Affiliate Radio System, military affiliated Amateurs
who provide free communications for overseas GIs and other
Federal services. MARS operators are licensed under DoD
instead of FCC.
NTS National Traffic System, a way to send radiograms
OM Old Man, refers to any ham, including female hams
packet computer bulletin boards/electronic mail via Amateur Radio
QSO One of the Q signals used in Morse code to mean "conversation"
RTTY Radio Teletype - older form of computer communications on HF
SAREX In Amateur Radio talk, Shuttle Amateur Radio EXperiment, a
chance to talk to astronauts in space. In CAP talk, Search
and Rescue EXercise, practicing for the real thing.
SSB Single Side Band - need less band width than AM or FM
SSTV Like ATV but slower and used on lower bands
UHF Ultra High Frequency - 300 MHz and above
ULF Ultra Low Frequency - 30 Hz to 300 Hz
VHF Very High Frequency - 30 MHz to 300 MHz
VLF Very Low Frequency - 300 Hz to 30 kHz, audio frequencies

YL Young Lady, non-ham girlfriend or female ham
XYL eX-Young Lady, or wife
2m Shorthand for "2 meters", which is a reference to the wave-
length of a common Amateur frequency band used for local
communications

** What do all those "tones" mean?
Sub-Audible Tone: A low tone that you're not supposed to be able to
hear. It's used as a "PL Tone." PL is "Private Line", a trademark
of Motorola for their implementation of CTCSS (Continuous Tone Coded
Squelch System). Basically, the transmitter sends the signal with
the Sub-Audible tone and the receiver only opens when it hears signals
with that tone. Signals without the proper tone are ignored. This
is useful for "closed" repeaters, or for repeaters on the same
frequency that have overlapping geographic areas.
Tone encode refers to the feature of providing the tone on transmit.
Tone decode refers to the feature of responding to the tone on receive.
Tone squelch refers to all of the above. DTMF refers to Dual Tone
Multi-Frequency, or "Touch Tone" which is a trademark of AT&T. DTSS
probably means Dual Tone Squelch System and refers to the feature of
providing a predefined sequence of Touch Tone digits to open the
repeater for transmit. DTSS is an alternate method from CTCSS, which
provides a way to use a "closed" repeater even if your radio doesn't
do Sub-Audible Tones.

** Where can I learn more about Amateur Radio if I live outside the USA?
Write to the ARRL and ask. They can usually tell you how to get a
license in your country.

** How can I get a "reciprocal license" if I am a licensed ham from another
** country?
You need to submit a FCC Form 610-A to the FCC, PO Box 1020,
Gettysburg, PA 17326. They will then send you a reciprocal permit
for alien amateur licensee (FCC Form 610-AL). You must be a citizen
of a country with which the United States has arrangements to grant
reciprocal operating permits to visiting alien Amateur operators.

** My apartment complex does not allow outdoor antennas, now what do I do?
First of all, don't dispair. Many hams have similar problems. Many
books offer advice for the growing group of hams that cannot put up
antennas. Some options are:
* Install an "invisible" antenna made of magnet wire.
* Disguise an antenna as a flag pole.
* Install an antenna in the attic.
* ASK the apartment manager. You may find they will let you put up
something as long as it "is invisible" or "doesn't disturb your
neighbors" or "doesn't attract lightning".
* Operate primarily from your car.

** I got TVI...HELP!!!
Here's some hints on Television interference, but this is not a
complete list. There are also books on the subject available from

ARRL.
* If cable TV is an underground feed, look for central distribution box. Check for a grounding rod.
* Try installing torroids on the cable TV cable close to the TV, and maybe torroids on the AC cord as well.
* VCRs are notorious for RF leakers, try disconnecting the VCR.
* Check to see if interference is better or worse when cable is disconnected and you use rabbit ears instead. It could be the cable company's problem!
* Calling the cable company may get results, since they are also responsible for RF leakage from their equipment. However, they are very often obstinate. Good luck!
* Try moving the radio antenna further away from the TV sets. Make sure the SWR is LOW.

** What do you need to get started in packet radio?
Packet radio is a digital form of communication using radios. There are OTHER digital forms, as well, like CW, RTTY and AMTOR. To use packet radio, you'll need a radio (2 meters or 1.25 meters is most popular), a box that converts radio signals to digital signals that a computer can understand (called a TNC or terminal node controller) and a computer or terminal. For some computers or TNCs you may need special software as well. However, most TNCs and computers get along quite well with just a terminal emulator software package. Most personal computers can be interfaced to use with packet radio. Since there are many digipeaters, generally even an HT will work with packet radio.

For more information on packet radio, you might try TAPR (Tucson Amateur Packet Radio), PO Box 12925, Tucson, AZ 85732 (602-749-9479).

** What do I need to get started in satellite communications?
For more information about Amateur Satellite Communications, try AMSAT (Radio Amateur Satellite Corporation), PO Box 27, Washington, DC 20044 (301-589-6062). They also have an international net on Sundays on 14.282 MHz at 1900Z.

** Did you know that you can get college credit for being a ham?
It's true! You can receive up to 14 credits in electronics and engineering thru placement tests for CLEP (College Level Entrance Placement) exams and DANTES (Defense Activity for Non-Traditional Educational Support) exams if you have an Advanced or Extra class Amateur license. For more information, ask your campus education office or (for DANTES) your military education office.

** On what frequencies does JPL and GSFC retransmit the shuttle audio?
Station VHF 10m 15m 20m 40m 80m
| WA3NAN 147.45 28.650 21.395 14.295 7.185 3.860
W6VIO 224.04 21.280 14.282 7.165 3.840
W6FXN 145.46
K6MF 145.58 7.165 3.840
All frequencies are in MHz. Use FM on VHF, USB on 10-20m, LSB on

40-80m.
WA3NAN - Goddard Space Flight Center (GSFC), Greenbelt, MD
W6VIO - Jet Propulsion Laboratory (JPL), Pasadena, CA
W6FXN - Los Angeles, CA
K6MF - San Francisco, CA

731. Macintosh HyperCard Ham Stacks Announcement

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 11:54:45 UTC
From: dls@genrad.com
Message-ID: <42083@genrad.UUCP>
Source record: 295603

LATEST VERSIONS: Novice v3.3, Technician v3.5, General v2.3,
Advanced v2.3, Extra v2.3

This is another announcement about the MacIntosh HamStacks which I have created. If you are not interested, press 'n' now.

I have created five HyperCard stacks to help people practice for the written Amateur Radio tests. There is one stack for each of Novice, Technician, General, Advanced and Extra questions. Each stack is an interactive multiple-choice test, created from the entire question pool for that class of license. The test is randomly generated, using the algorithms provided for each of the tests from ARRL, so this is a real-live simulation of the tests you will get in front of a VE. There are some print capabilities (you can print a test with a separate answer key, but it's slow. you can also print your results of how well you did, along with the accompanying correct answer key) and at the end of each test, it will tell you how well you did, allow you to review the missed questions, and allow you to take another randomly generated test. If you can consistently score over 90 on the tests, it's almost a sure guarantee that you will be able to take and pass the VE proctored test.

Note that these stacks will only work on a MacIntosh computer. HyperCard version 1.2 or later is required; they were generated with HyperCard version 1.2. Because HyperCard data is NOT stored in any ASCII form, there is no way that this data can be used on other computers, including IBM PCs, so please don't ask for the impossible. Also, I do NOT have access to email these stacks over the computerwaves, nor do I have ftp capability. There are a couple of sites which are supporting these stacks via ftp, as follows:

These stacks are supported by ftp by Charley Kline, c-kline@uiuc.edu. To access the files, type "ftp uxc.cso.uiuc.edu", log in as "anonymous", with your email address as the password. Type "binary" at the prompt, then type "cd pub/ham-radio". The five hamstacks are (eg): novice-v3.2.hqx.Z, technician-v3.3.hqx.Z, general-v2.2.hqx.Z, advanced-v2.2.hqx.Z, and extra-v2.2.hqx.Z (or similar names). To retrieve one of the files, (for example, the Novice one), type "get novice-v3.2.hqx.Z". When you're finished retrieving all the files you want, type "quit" to exit ftp. Each file must be uncompressed before moving it to the Mac: "uncompress novice-v3.2.hqx.Z". You need to use Kermit to transfer the files to the Macintosh. The files must then be un-binhexed by UnStuffit, then unstuffed by UnStuffit.

The latest versions of the stacks are shown below, and are compressed with Stuffit Classic. UnStuffit is included on the diskette. These versions include modifications for NoCode (very minor changes from v3.0 or v2.0).
Novice version 3.3
Technician version 3.5

General version 2.3
Advanced version 2.3
Extra version 2.3

If you wish to receive these PUBLIC DOMAIN stacks from me, please send me a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette. I will no longer send out the stacks unless the envelope has sufficient postage for return mail (in general, that means .52-.98, depending on size of envelope) and for those who send a standard business envelope, I take no responsibility for the condition of the diskette through USnail.

Thank you for your attention.

|>
|>Can someone explain this to me? Why did I hear so many stations
|>in Field Day trying so hard to get the complete station class
|>and section from the station they were working?
|>

As is often mentioned, Field Day is a communications exercise, not a contest.

Part of the reason for getting the information is because it was The
Right Thing To Do. You were supposed to exchange the information. No
exchange occurs if you don't get the info, and our group would
occasionally declare "no contact" if we couldn't dig it out.

The other reason, unless you plan to be in the bottom ten, is that the
league *can* call for the complete log. You'd feel pretty silly going
through the trials and tribs of Field Day, make a good showing and then
get disqualified because you had incomplete logs.

|>By the way, the consensus seems to be that "UR" indeed does stand for
|>"you are" and thus really isn't conveying its usual meaning as such,
|>but in any other contest you'd say "UR 599", so at field day I guess
|>"UR 5A IL" is just natural.
|>

Everyone has their little hot button about Field Day and that one is mine. In the wee hours, when there's a little more time to be playful, if someone comes back and says "you are 22A East Overshoe" (or some such) I give as my exchange "No, YOU are 22a East Overshoe, WE are 2A Eastern Mass." It often gets a chuckle from the other end (and I notice they often switch to "we are" for subsequent contacts.)

I know why people do it; they're used to "you are 59 into East Overshoe" -- just like the people who call "CW contest" instead of "CQ Field Day" or who start to give you their own call instead of their Field Day call -- they just can't kick the habit. But for some reason it just bothers me to hear it.

|>writes:
|>
|>>Are there any RF characteristic differences (loss, etc.) between full
|>size
|>>RG-8/U and mini RG-8/U? I can get a better price on the mini coax
|>(even with
|>>the added cost of adaptors for the PL-259 connectors), but first
|>priority
|>>is performance. Thanks for the input.
|>
|>I'm interested in this question, too. My understanding is that the
|>so-called "mini RG-8" is capable of handling high power like real
|>RG-8,
|>but that it has loss characteristics more like RG-58.
|>

According to my Belden catalog, the attenuation in db per 100 feet at 50MHz for RG-8/U type (their 8214) is 1.2, for RG-8/X (their 9258) it's 2.5 and for RG-58/U (their 8240 or 9201) it's 3.1. They don't give a power-handling rating.

>I set a couple memory channels, turned the power off, then back on, and it
>didn't remember the memory channels I had just programmed in.
>Comments?
>--

The manual specifically warns that the radio will not accept input during battery failure mode. It does not, however, warn *exactly* what will happen if you allow it to continue.

I have discovered that the unit *can* be switched on with no battery attached, thus indicating it has *something* constantly monitoring the power switch (a "soft" switch, I'm sure you noticed). Don't misunderstand, nothing appears on the display. But if you remove the battery, turn the rig on, then reattach the battery, you will see what I mean.

As for the lithium battery, if you ran it *dead*, then immediately expected it to maintain your memories, I shouldn't be surprised if it failed. Give it a couple of hours on a fresh main battery, then see if it holds your programming. On the other hand, it may indeed have been ruined.

73 and good luck!
Mike

I recall that in Britain there is an organisation called the
Radio Amateurs Invalid and Blind Club (RAIBC). I was a member, in
Cardiff- Wales, of a radio club based at a community disabled centre.
There were a number of hams there who were blind and used the
facilities of the RAIBC. The RSGB could probably put anyone
interested in touch with them.

740. Field Day

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 15:14:00 UTC
From: DERRY@ROSEVC.Rose-Hulman.EDU
Message-ID: <F036AD39C0201680@ROSEVC.Rose-Hulman.Edu>
Source record: 295608

Hi FDers:

The Wabash Valley Amateur Radio Association (Terre Haute, IN), W9UUU, had its FD in a city park. We operated the first hour or so in a thunderstorm. Three inches of rain fell on us, but we already had the antennas up.

The park personnel wisely closed the swimming pool when the storm broke. As a part of the pool closing ritual, they also LOCKED THE RESTROOMS. They remained locked Saturday and Sunday. We improvised by driving a few blocks to Hardee's when necessary. We now have a whole new euphemism, "Going to Hardee's".

Operating 3A plus a nov/tech station, we made a "few hundred or so" contacts not yet tallied. One major plus was the logger program I used on my HP-48SX calculator. All my duper had to do was enter the call and immediately the hand held computer displayed either "Dupe" or "Work 'em!".

Pressing another key automatically logged the contact (whether you need it or not) and any report you wish to enter. I used NO dupe sheets.

The other plus was that with the exception of the novice/tech station (which unwisely stuck to 10 meter phone exclusively) all of our antennas were multiband. They were:

(1) a 132-ft center fed Zepp fed with 300-Ohm twin lead from the balanced output of a "tuner" (all bands), the antenna is portable and can be set up by one person

(2) a high long wire (all bands) matched by the AT in a TS-440

(3) a Cushcraft R-5 (10,12,15,17,20), and

(4) a tunable mobile whip.

Being able to QSY as condx indicated was a definite advantage.

There was no 10-meter activity on Saturday, so the operators of the nov/tech station went home. Sunday morning 10 meters opened up, but they did not return. SAD!

Many of the regular 17-m band dwellers were obviously chagrined that we were operating FD on 17 meters. But, I noticed little activity on 17 when I was on.

The CMOS Superkeyer II took much of the drudgery out of cw operation. Both cw operators used one. It's a great little aid (Nov. 90 QST).

Congrats to all who participated. Whether you were in it for the COMPETITION or not, I'm sure you had fun and got some valuable experience out of it. Hey, let's do it again next year!

I am sure English is not the 1st Language of many participants on the news list either. Are you suggesting we all use only Q-codes?

While English may be the predominate language on the net, and it is helpful to us ignorant Americans (when it comes to languages) to have everything in Amerikun English --- I do not think that we need to restrict those who wish to use their native tounge in discussing a topic of interest to a sufficiently large enough audience who are conversant in that language.

I speak English and can read C, Pascal, FORTRAN, and a little French and Assembler.

:)

742. 1/4-wave, 5/8-wave?

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 15:56:04 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <27.Jun.91.17
Source record: 295541

Having tried a good number of mobile antennas for 2 meters, my feelings are like so:-

1/4-wave: Low profile (so does not attract attention to the fact that you have radio on board) but also low gain. No risk of taking out the florescent tubes in underground parking lots. Mag-mount 1/4-wave does not 'walk' along roof. Needs groundplane so no good with fiberglass vehicles.

1/2-wave: More obvious (due to matching transformer at base) but more gain. Works on fiberglass boats/cars. If roof-mounted, you get to see how brittle an exposed florescent tube is the first time you drive into your garage. Mag-mounted 1/2-wave stays put on roof (unless body is fiberglass!!).

5/8-wave: Same visibility problems as 1/2-wave. Same length problems as 1/2 wave. Needs ground-plane so no good for boats/fiberglass cars. Not any noticeable gain improvement over 1/2-wave. Tends to 'walk' when magmounted if your cruising speed is high (national limit over here is 70MPH but the police would give you a ticket for loitering if you obeyed the limit...)..
Can be trunk or fender mounted to reduce height but gain is less and strange things happen to polar diagram.

5/8-over-3/8-collinear: this is one BIG antenna! Needs groundplane, noticeably better gain compared with 1/2 or 5/8wave in open country, makes finding covered parking areas difficult unless you take the antenna off every time. Subject to damage from overhanging trees. Mag-mountable only if you never exceed 5MPH. Gets you some real strange looks from other drivers. Destroys esthetics of almost any normal-sized automobile.
Bends back badly at high speeds (so probably OK for working satellites or aircraft). Needs reinforced mounting to take the strain.

What do i use? Well, a roof-mounted Antenna Specialists 1/2-wave on my (fiberglass) car, and a magmount 1/4-wave for when i have Hertz rental transport or an other vehicle that i am not able to drill. Its a case of compromising efficiency against appearance and convenience.

|> armstrong.cs.buffalo.edu: 12145 May 1 12:11 pub/ham-radio/faq3

Ouch! Everyone *please* forget that you saw the name armstrong here. The ftp site here is known as ftp.cs.buffalo.edu and is actually an alias rather than an actual machine. This alias used to point to armstrong but since this machine was retired it now points to a different machine (and I'm not gonna tell you which 8-). Please only use the name "ftp" in the future. Abstractions are our friends.

|> Apparently the armstrong host likes to chop things up into small files.
|> It's the hassle of the small files that I use FTP to get away from :-(

What would be preferable? I figured mget would be sufficient for multi-file tranfers but if there is a better suggestion, I'm open to it.

|> It is also not named with the name of the newsgroup, so people won't
|> find this if they search using "rec.radio.amateur".

Good point. I'll add a link for this.

All you gotta do is ask... 8-)

In article <1222@ssc.UUCP> tad@ssc.UUCP (Tad Cook) writes:
]
]Can someone explain this to me? Why did I hear so many stations
]in Field Day trying so hard to get the complete station class
]and section from the station they were working?
]
]In ARRL Sweepstakes, I can understand the need to get the exchange
]right. You have to log it correctly. But in Field Day, you don't.
]The only requirement is to exchange the info, but there is no logging
]requirement. Under "REPORTING", the rules say:
]
]"A complete entry consists of an official ARRL summary sheet and a
]list of stations worked on each band/mode during Field Day, plus
]bonus proof."
]
]The rules go on to state that the list of stations worked is just
]a dupe sheet, with no other info. It does say that you should keep
]a copy of the Field Day log (but unlike Sweepstakes or other contests
]{Field Day is an operating event, not a contest!} it does not define
]what goes into the log) but says not to send it in unless requested
]later by ARRL.
]
The way I look at it, this is an issue of trust. There's a degree of
trust involved in all contest entries, and if you cheat a little you might
as well cheat a lot, since the results are meaningless anyway. Whether
you have to send it in or not, you are required to log the contest exchange.
In fact, I have a whole bunch of contacts I dumped from the log because the
guy moved away before ever hearing me tell him I didn't get his section down.
Since field day isn't billed as a contest (even though it walks like a duck
and quacks like a duck), there's a bit more trust involved in field day
entries than there is in most other contest entries. But as Todd pointed
out, the ARRL reserves the right to request the station log. And they do.
Just a couple of weeks ago I got a very polite letter from KR1R at the ARRL
contest desk asking me to upload my ARRLDX contest logs to their bulletin
board so they could do an electronic cross-check. When I called him to ask
what I had done to arouse his suspicions about my log, he explained that they
were doing this with ALL of the high scorers. And believe me, my score
wasn't that hot! So be warned: not only is it not following the contest
rules to just skip logging the exchange, but if you do well enough you could
get your whole entry disqualified.

745. 6 meter QSL from blind ham in Alaska

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 16:21:52 UTC
From: wade@gazers.enet.dec.com
Message-ID: <5373@ryn.mro4.dec.com>
Source record: 295624

finally received a QSL card from NL7OW (Alaska on 6 meters) -
it had come blank twice, so I finally typed in all the info,
included a pen, and asked him to just sign it and stuff it
in the SASE.

there was also a note on the back:

"Mr. Corbitt is blind and has lost his helper. He lives
very far from any town. He ask if all the good hams who
would like a card to understand. He ask if you would PLEASE
pass the word around the 50 MHz newsletters."

this is the only newsletter I get - please pass it along.

>PESCATORE_JT%NCSD.DNET@GTE.COM

Sorry, I'm guilty. If the other station is below 59, I send it twice.
That usually takes less time than in the long run since the big overhead
is in the turnaround. I've had to turnaround four times when the QRM is
heavy.

OK, so it takes 5 seconds more on an exchange. If you want to contest,
don't go to FD :) .

Ethnocentrism at its finest. Perhaps these people did keep the posts to the only language they could understand? I find it hard to understand why we have no problem posting in English with "world" distributions but they are expected to conform to our language standards when doing the same.

751. K1LT in Ohio Field Day

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 18:14:27 UTC
From: kean@b61512.im.battelle.org
Message-ID: <1322.2869e4b4@b61512.im.battelle.org>
Source record: 295615

Alumni of The Amateur Radio Club of The Ohio State University
1991 Field Day Summary

For many years members of The Amateur Radio Club of The Ohio State University, Inc., W8LT, hereinafter referenced as the OSU Radio Club, have operated Field Day under the call W8LT. A number of traditions had evolved, including the use of a particular site, no advance setup, etc. Gradually, the number of participants decreased and the emphasis changed from "maximizing score" to "maximizing score while minimizing effort". Finally, the OSU Radio Club demanded that those still operating Field Day as W8LT cease and decist since there were no longer any current OSU Radio Club members participating in that effort.

Nevertheless, a few individuals have continued to return to the traditional site each year to operate Field Day. This year, K1LT and K8ND made the trek to the Blue Rock State Park fire tower, near Zanesville in eastern central Ohio. Although there was no official "secret Weapon" this year, we decided to abandon generator framulation (two generators and a switch box) and substitute battery backup. The new TR7 final transistors arrived Friday afternoon and I converted the venerable NMOS microprocessor keyer to battery operation, which provided me the opportunity spend most of Friday night hacking things electronic (another tradition).

Saturday morning we accumulated a subset of the usual pile of stuff and loaded into the K1LT vehicle and the K8ND vehicle. This year, we left behind the second generator, the 250 foot 4 times 12 gauge "extension cord", the backup HF radio, the two 4 by 8 foot work tables, and the army field tent and its 2x4s. Also, my family elected to forgo this Field Day, saving another load of camping and entertainment equipment. Thus, all the equipment fit into two small vehicles, and could actually be loaded in less than two hours.

As usual, departure was scheduled for 1400Z and was actually accomplished by 1600Z. After dodging unexpected orange barrels (not to be confused with the expected ones) and thunderstorms, K1LT and K8ND arrived at Blue Rock at 1740Z, only twenty minutes before the official starting time. Although we outran the thunderstorms along I-70, the rain was rapidly closing. So, we hastily erected the tent and tossed in the equipment. By this point, Field Day 1991 had officially begun.

To make a potentially long story shorter, we quickly hung a 7 MHz sloping dipole from the fire tower and K8ND began operating. Initially, the TR7 was very unstable, but a quick tweak

of the ALC control and the removal of the cabinet settled the radio enough to operate. So, while ND made 55 CW class 1A QSOs per hour, I put up a 3.5 MHz open wire fed dipole, a dual band collinear on top of the fire tower, and set up the packet station.

Operating packet radio during Field Day in eastern Ohio has been an increasingly futil experience. Five years ago, we worked 60 stations in 9 states. This year we worked 4, and we had to use the network to access a node in Columbus to get any attention. One problem is that our location is an exteremly fine example of an exposed transmitter. On 145.01 MHz, the carrier detect never goes off. However, it seems as though there should be more packet QSO activity, given the non-stop bit stream we observed.

K8ND and I traded off operating and eating until about 0430Z, the traditional time to figure Field Day strategy. At this point there were 450 7 MHz QSOs in the log, and a desire to switch to 80 meters to catch some of the action there. K8ND observed that the QSO rate was holding up fine on 40 meters, while I opined that changing bands and retuning the antenna tuner could invite a failure. Nevertheless, a band change was deemed appropriate. So K8ND retuned the antenna tuner and the TR7 went "tink". After poking around on the TR7 final amplifier board for a few minutes, I declared the radio "dead", and that it was time to listen to "UHF" on the portable CD player (a "Weird Al Yankovic" album).

The next morning, the section manager message was transmitted via packet and everything was torn down. The final result was 450 QSOs at 4 points each, 1800 points, plus bonuses for Field Day bulletin received, 100% emergency power, section manager message, and "public place" operation, although only one couple braved the rain to visit the picnic area adjacent to the firetower.

Just wait til next year ...

-Vic, K1LT @ W8CQK or kean@bclcl1.im.battelle.org

>transformes, so I'm a bit concerned about that.

The 32S-1 does indeed require an external power supply; the 6146 finals
require +300, and you need to supply the filament and operating voltages
for the drivers.

I don't happen to have the manual in front of me, so I don't know what
the pinout for the Mike is.

Tuneup is the standard "peak the grid, dip the plate" procedure.

Aw, c'mon Scott. Lighten up a little bit! This is an
international forum, isn't it? I personally feel that the
international contributors add a stimulating dimension to the
forum, even if I have to do a little extra work to "decode" the
French text. French is a very popular second language in the
USA, and I'll bet that you could print off the French text and
within your circle of friends & acquaintances there is someone
who would enjoy translating it for you!

As for me, my two years of college French are not up to the task
of translating the message, and I'm seeking out a former
instructor to assist.

Au revoir et bonne chance, mon ami!

755. RG-8 vs RG-8X coax

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 19:25:23 UTC
From: IANR003%UNLVM.BITNET@cunyvm.cuny.edu
Message-ID: <9106272059.AA00684@ucsd.edu>
Source record: 295485

Every ham should go to their local electronic supply store and pick up a usually free BELDEN cable catalog - loads of information. First of all, "what type of coax to get" is very dependent upon the use - is the length 50ft or 500ft? Do you work repeaters, or moon bounce? Are you looking for something for you HF or UHF antennas? At HF, you can use RG-58 (the small stuff) up to a 100ft or so without any great problems, as long as you don't run a KW power level.

Remember that a 3Db difference is basically a difference of 1/2 power. For example, if you put 100 watts into a cable with a 3Db loss, then you get about 50 watts out the other end. A 6Db loss would leave you with 25 watts. The difference between a 100 watt transmitter and a 200 watt transmitter is 3Db. Also, a difference of about 3Db is almost not detectable by the human ear, and is about 1 "S" unit on a radio (on my radios, it is the difference between S1 and S1.5 on the low end of the meter, and S7 and S10 on the upper end - obviously, the meater is not calibrated very well, and the weak signal is the important one anyway - who cares if you are S7 or S10???).

Another fine point. Many coax cables are not made to the EXACT specifications that you might think. For example, RG-8 is RG-8, and that is all there is to it. Manufacturers get around this by throwing in the word TYPE. For example, an RG-8 TYPE coax is simply a cable that looks like an RG-8 cable - the type of insulation, the type of center conductor, and amount of shielding may all be different as compared to the "RG-8" standard. This does not mean the cable is bad, just that it is different. Only really critical users (moon bounce) may ever care.

The following info comes from the 1989 or 1990 BELDEN catalog. It does not represent all of the information on the cable, nor all of the common types of 50 ohm cables - this is just the information that I usually find interesting.

BELDEN OUTSIDE VELOCITY OF SIGNAL LOSS
COMMON NAME NUMBER DIAMETER OHMS PROPAGATION SHIELD (Db/100ft)
---------- ------ -------- ---- ---------- ------ ----------
RG-8/U TYPE 8214 .405 50 78% 97% 50Mhz 1.2
(what most hams use for serious work) 100Mhz 1.8
200Mhz 2.7
400Mhz 4.2

?? 9913 .405 50 84 100% 50Mhz 0.9
(Great for 400Mhz and higher) 100Mhz 1.3
200Mhz 1.8
400Mhz 2.7

RG-8/U 8237 .405 52 66 97% 50 1.3
100 1.9
200 2.7
400 4.1

RG-8/X 9258 .242 50 78% 95% 50 2.5
100 3.7
200 5.4
400 8.0

RG-58/U 9201 .193 53.5 66% 95% 50 3.1
100 4.5
200 6.8
400 10.0

This book does not indicate power levels, but 58 should be good to a couple hundred watts if you have a low SWR, 8/X probably up to 500 to 600, and the big stuff is mandatory if you are at a KW or more. As you can see, 8/X is not that much better than 58 (only 1.5Db difference at 200Mhz), but is better for higher power. Also, there are differences between 58/U & 58A/U, the main difference being that the A/U has a stranded center conductor. I use 8/X coax for many of my HF and VHF work, as it is very flexible, does have a slightly lower loss, and just looks like it should be better. My UHF cables are 9913 - stiff stuff because it uses a 9.5AWG center conductor, but one of the lowest loss cables around next to hardline (I should have mentioned that my VHF work is mainly through repeaters, but one of my VHF radios does have 8214 to a beam, and my HF work is 100 watts only and 75ft of coax).

Hopes that helps.

This year's June VHF Contest was an absolute blast....6m had every mix of propagation one could imagine (except F2) and the other bands were hopping with occasional tropo (at least from eastern PA). I have been involved with the K1TR group (Bird's Hill VHF Society) for 3 years now and I think this event, and the associated learning process, is the most fun I have in Amateur Radio.....

Here are some score rumors that I've been able to gather since the contest. We heard lots of stations in the new rover class......anyone from the PA/NJ/NY area or from New England who's interested in roving should contact me....

Please post any other score rumors or e-mail them to me...thanks.

- Hmmm... Not according to Larson Electronics. See previous posting.

- Bob Witte / HP Colo Springs / bobw@col.hp.com / KB0CY

- -

I also have to agree that a 1/2 wave end-fed vertical antenna does
not become "disturbed" around a ground plane. I just measured a
batch of different brands of this type of antenna by looking at
the return loss. It didn't matter whether there were large metal
objects underneath (or nearby) the antenna, or not. The return
loss indicated a very good match at any position of the antenna.

Now rubber ducks were a different story. Their resonant frequency
varied all over as the position or nearness to large metal objects
was changed.

As a matter of fact, 911 _does_ get many hoax calls and so the operators are trained to attempt to screen calls as best they can. With the normal 911 systems (first generation), the operators do not get name and addr info when the call comes in. Consequently, no challenges. HOWEVER, with enhanced 911, folks who call in from repeater sites, as well as from cellular phones(!) may run into this problem. Usually, the explanation that you are using a ham radio system or "mobile phone" system is adequate. This is a problem that needs to be addressed. Probably the best technique would be to contact the appropriate public safety director of your local 911 service. I know this doesn't help your specific situation (traveling), but if we all took it upon ourselves to better educate the 911 operators, then this might become less of a problem.

In the 60's we did much research & experimenting with altered metaphysical alchemy (AMA) and came to the same conclusions. But, in our experiments the crystal energy field had to be excited by the vertical positioning daemon that ran continually at hyperbolic speeds*. As you all know the time-domain refractrometry experiments at Mt. Bethel (Fastenock), NY proved to be futile, much like the recent transgression into psycho-cybernetic-fusion, aka cold borsht.

I personally liked:

November Six Wild Girls(N6WG, with a YL operator)

I was with the W6YX group (Whiskey Six Yankee X-ray), Stanford ARC.
We operated from a former ATS satellite uplink station in the Stanford foothills. We ran class 2A Battery, with packet, novice, and satellite stations. We made about 40 QSOs on Oscar-13, and about 40 on packet. I also made about 40 QSOs on 2 meter simple 146.52, and about 5 on 446 simplex (with an old tempo S4).
We put a 7 element HF beam on a 50 foot pole that was set in a thrust bearing (who needs a rotor :-), we also ran a tribander beam on 10-15-20, a 40m dipoe, a multiband dipole, a dalband 2m/70cm vertical, and a 4 element 2m beam. Radios were a TS-440, a IC-720 for the CW station (with the 7element beam), and a kenwood th-21 HT for 2m, and a tempo s4 for 440. We also had a novice station using an Argonaut.

The satellite station was a homemade helical on 432, 11 element crossed yaggi on 2m, an ic-390, and a ic-245 (which replaced the ts-9130).
Contacts made included W6BB (UCBerkeley), and WA3NAN (Goddard Space Center)

The biggest problem was getting the 7element beam on top of the pole (lots of fun). The second problem was the 2m repeater that was up the hill 200 yards (145.23, you know who you are), whenever it keyed up, it wiped out the bottom end of 2meters :-(

The kenwood ts-9130 was very sensitive to the repeater, but the ic-245 didn't have as much of a problem, which surprised us. It was also able to hear the satellite better (!)

The 7element beam was left in place for future use, as the site may become the permenant station site for the club.

All told, we racked up about 7500 points.

---
True...FD is not a contest. The reason is that if you win, you do not
win; there are no prizes. Although, as Edna, WK7V, puts it, "You win
'bragging rights'". Also, your group's call gets put in the box in the
FD writeup. The ARRL DX contest, for one, is a contest. Lots of plaques
and certificates are awarded to the winners every year.

911 seems to have that limited capability of contacting anyone
outside the specific coverage area. I once attempted to report a riot in
East Lansing following the Detroit Tiger win in the World Series,
calling from an East Lansing payphone. The 911 operator was in Lansing,
and could not pass the information on.

> In TN an accident occurred behind me on a busy street inside a tunnel.
> Similarly, upon contacting 911, I got the challenge "Well sir, you
> couldn't possibly be where you say you are because I have your name,
> address and phone number right in front of me." Identifying myself as a
> ham radio operator and explaining the equipment quickly seemed satisfactory
> to this person, but who knows.

The local repeater has a 911 quick-dial that dials into the County.
The suggestion of the club (passed on from the people who answer the
phone) is to start the report with "This is amateur radio station X1ABC,
how do you hear me?". This serves to impress on them that they are
talking on a radio link. Some of them go as far as using their police
callsign over the autopatch.

> If you've had interested experiences with 911, post them and maybe
> the next time there's a problem they can be downloaded, printed out,
> and used as evidence that some sort of local policy changes or additional
> training for these people would be helpful.

The only changes that need to be made are better coordination between
the hams and the cops, with the hams who set up 911 autopatch systems
making sure that the cops know that it is there. The problem you ran
across in TN is the fault of the autopatch owner for not making sure
that the E911 data record explained that the line was a radio link.

I would agree. All autopatch operators (phone line owners) should make the
existance of the system known to the 911 management in their area so they
can do whatever is best to handle it. Hopefully such phones are dedicated
just to the autopatch usage so as to not complicate the description of the
phone line in the E911 database.

Perhaps a short voice recording system can be added that states that the
call is coming from a mobile radio system, so that each user won't have to
remember to say this. Sometimes emergency situations get rather nasty.

769. RG-8/U vs RG-8/X (mini RG-8)

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-27 22:39:08 UTC
From: kj9u@uhm.ampr.ORG
Message-ID: <4716@uhm.ampr.org>
Source record: 295495

This data was taken from the 1989 Belden Master Catalog.

8214 (RG-8/U) 9258 (RG-8X)

center conductor 11 AWG (7 strands of 19 gauge) 16 AWG (19 x 29 ga.)

Nominal O.D. .405 in (10.29 mm) .242 in (6.15 mm)

shield bare copper 97% coverage bare copper 95% coverage

nominal impedance 50 ohms 50 ohms

velocity factor .78 .78

capacitance 26 pF/ft 26 pF/ft

outer jacket black PVC black or white PVC

nominal MHz attenuation	dB / 100 ft -----	db / 100 ft -----------
1	.14	.5
10	.5	1.0
50	1.2	2.5
100	1.8	3.7
200	2.7	5.4
400	4.2	8.0
700	5.8	11.1
900	6.7	12.8
1000	7.1	13.5
4000	18.0	xxxx

I didn't see any max voltage ratings, but RG-8X has a much lower rating
than RG-8U due to its smaller diameter. (The important consideration here
is core insulation type and diameter.) RG-8X is not meant for use with
kW class gs unless your SWR is 1:1.

I hope this helps.

Aloha,
John Shalamskas KJ9U

At W6LFJ, we had so much interest from the Novice/Tech crowd, that they
put FOUR stations on the air (signing KB6PTA). Of course, only 1 counted
for free. Actually one of the stations was packet, and since they were
on 2 meters as well as 10, they were signing W6LFJ.

So we were "5A" with 7 transmitters. (The packet station is also "free"
according to FD rules.)

Drop it boys ! They've got the point. Since my posting (that you
didn't see of course), and that was even before the first of these
complains, I have corrected the newsgroup distribution of this discussion.

It is unfortunate that some people just don't pay attention to
where their answers might be cross-posted to. They read soc.culture.french
(where most of the postings are in French) and think that the message is
posted only there and that they can post an answer to it in French.

Usually, just one message reminding the readers that the distribution
should be corrected is enough. There is no need to post 4 messages in 2
different languages for that (especially when they all say the same
thing), or the cure might be worse than the disease (-:.

Please, on beneath of the people making this kind of mistake, excuse
them . Thank you.

>The only requirement is to exchange the info, but there is no logging
>requirement.

The rules also state that you must submit a log if required by the
contest checkers. Besides, how can you "exchange" the info without the
receiving station copying it? The intent of the rules is very clear:
you are supposed to correctly copy the exchange and enter it in the log.

>Not worrying about logging any times or the other station's
>section or class really made things easier. But it sounded like
>a lot of other stations were going to a lot of extra trouble.

The times are not required, but the exchange is, IMO. I believe that
if you dont log the exchange, and the ARRL checks your "log", that
you will be disqualified.

I always assumed that using the Novice callsign for the Novice station
was not optional. Besides, why would you not want to? Otherwise you
have to cross-check the Novice and General+ logs to make sure there were
no duplicates. With separate calls, you can work the same station
twice on the same band.

>... The SSB rig was an ICOM 781, and it was getting swamped by the CW
>stations's 100 watts. I know this is an old problem...

The problem is synthesized radios. If either one of the two radios
(on the same band) is synthesized, BOTH radios will be susceptible
to interference due to the phase noise in the synthesized radio.

The best FD radios are the old (tube-type!) Collins and Drake units.
The Collins "S-line" (75S3/32S3) and KWM-2 are good, as are the Drake
"4-line" (R4x/T4x where x = A, B, or C) or TR3/TR4. With these rigs,
we have succesfully operated General CW, Novice CW and General Phone
on the 80 meter band simultaneously with antennas only 100 feet or
so apart (but oriented at right angles). A brand new, multi-kilobuck
TS-940 rolled over and died in the same situation. It received
and caused severe interference from/to the Drake 4-line. When we
replaced the proud TS-940 with the old, beat-up TR-4, the problem
totally disappeared.

The answer: Drake or Collins radios and as much antenna separation
as you can get.

You are correct Paul, armstrong is no more (it is sitting in the machine room with all the cables to the outside world disconnected) however do not despair! All of the ham information that armstrong used to host is available (as before) from the host ftp.cs.buffalo.edu, maintained through the good graces of Devon Bowen (KA2NRC).

779. NYPD Jammer Caught

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-28 06:21:36 UTC
From: mab@duvel.princeton.edu
Message-ID: <mab.678090096@duvel>
Source record: 295506

For quite a while now, the NYC police have been bothered by a jammer calling himself the "Voice of god" on the lower Manhattan radio division. The jammer would interfere with police calls, and would taunt the dispatchers and cops for hours on end.

On Tuesday, June 18th, NYC police, assisted by members of its Communications Division and the FCC. arrested Noel Wo and an additional, unnamed individual in their lower east side apartment. In their possession was over $100k worth of radio equipment stolen from Barry Electronics, a local Ham shop. The arrest represents the culmination of a long investigation that included the NYPD radio shop, police internal affairs, and the FCC.

No details yet on exactly what they've been charged with.

I guess the moral of the story is if you have to jam, stick to ham frequencies, where no one important cares. :-)

780. Re: CHP on 800MHz

Newsgroup: rec.radio.amateur.misc

Message-ID: <3244@public.BTR.COM>
Source record: 295505

I don't think they are moving the CHP vehicle radios up to 800Mhz.
What they are doing is to consolidate the bay area command centers into one location for the region (Vallejo). They are also moving their links from 72Mhz to 950Mhz.

One reason for this is propagation. Lo-band VHF frequencies tend to carry longer distances. This means that they can use fewer transmitter sites per area, with fewer dead areas. (when the conditions are right, LA County can be heard across the country)

On the other hand, a lot of the other state agencies are moving to an 800Mhz trunked system. This includes CALTRANS, Adult Corrections, and some inter-agency mutual aid.

781. MAJOR SOLAR FLARE ALERT - 28 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-28 08:40:32 UTC
From: oler@HG.ULeth.CA
Message-ID: <910628024032.20200748@HG.ULeth.CA>
Source record: 295508

-- MAJOR SOLAR FLARE ALERT --

JUNE 28, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

The first signs of the possible return of old Region 6659 have been observed over the last 24 hours. Strong calcium emissions on the northeast solar limb have been observed, together with an optically uncorrelated long-duration major solar x-ray flare. This flare began at 04:54 UT, peaked at 06:25 UT and has not yet ended (07:50 UT on 28 June). The flare has been rated a class M6.0 x-ray event with a gradual rise and decay x-ray signature. This event appears to have been lacking significant radio emissions. As well, no sweeps were observed from this event. The post-flare phase is still in progress. More will be known later this UT day.

The background x-ray flux as well as the 10.7 cm radio flux have been increasing over the past 24 hours. The appearance of intense calcium emissions around the latitudinal zone of old Region 6659 (~ 30 degrees north latitude) together with this most recent major flare suggests that old Region 6659 will soon rotate back into view. There is still uncertainty regarding the potential size and level of activity which may be witnessed from this region. Major flaring will obviously be a concern if this region failed to decay as was expected.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

This last major flare will not have any terrestrial impacts. If the region which spawned this event originated on the northeast limb as is suspected, the potential for further major flaring will be elevated quite substantially over what has been predicted. If old Region 6659 is still in a complex configuration, occassional X-class flares will not be out of the question.

Note that when old Region 6659 will be given a new region number as it appears around the east limb. This is standard procedure. All regions which appear around the east limb are renumbered.

The Potential Major Solar Flare Warning has been issued and is now in effect as of 06:30 UT on 28 June. Further major flaring may be possible over the next several weeks. Once the region in question rotates into better view for analysis, this warning will be reassessed.

** End of Alert **

782. POTENTIAL MAJOR SOLAR FLARE WARNING - 28 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-28 09:27:16 UTC

Source record: 295510

/\

POTENTIAL MAJOR FLARE WARNING

WARNING ISSUED

/\

June 28, 1991

ATTENTION:

An optically uncorrelated major class M6.0 x-ray flare was observed at 06:25 UT on 28 June. The region responsible for this flare is believed to be just around the northeast solar limb (which has not yet rotated into view). Very strong calcium emissions being observed on the northeast limb at the present time may be the leader portion of old Region 6659, which produced the large barrage of very powerful solar flares several weeks ago.

Additional evidence pointing to this region as the possible source of energetic solar activity has raised concerns of a possible recurrence of major solar flaring with the return of this region back into view. Region 6659 could return at any time now, but should be almost fully in view by 30 June or 01 July.

Until this region becomes visible and can be inspected more closely, this Potential Major Solar Flare Warning will remain in effect. After a preliminary analysis has been made, it will be reassessed.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
June 28 to July 07, 1991

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0

Based In-Part from Data Supplied By
The Space Environment Services Center

SOLAR TERRESTRIAL REVIEW FOR 21 JUNE TO 27 JUNE

Solar activity during the last week has been generally low. A few minor M-class flares were observed, but activity was substantially lower since the departure of old Region 6659 almost two weeks ago. No major flares were observed throughout the period. A few disappearing filaments were observed as well as a few erupting prominences and a couple of unique low-level C-class flares, including a recent C-class event which sported a massive 245 MHz radio burst of 180,000 sfu at 20:12 UT on 26 June. This event was associated with a 1,600 sfu tenflare and moderate Types II and IV sweeps. There is some uncertainty regarding the location of this flare. There was not a distinct optical correlation with the x-ray burst, which was rated as a low-level class C2.9 event. The only phenomena which can presently be attributed to these x-ray and radio observations was an erupting prominence, which was ejected to a distance of 0.11 solar radii on the west limb.

Over the last 24 hours (since 27 June), indices have been climbing more steadily. The background x-ray flux has also increased notably. Surging has been noted on the northeast solar limb, together with very intense calcium emissions, indicating an active region is ready to rotate into view. This could be the leader area of old Region 6659. The solar flux for 27 June also jumped notably from 185 on 26 June to 200 on 27 June, lending further evidence of a returning active region.

Geomagnetic activity gradually declined from the active levels which have been witnessed over the last several weeks, to more dormant levels of unsettled activity. Minor storming was observed over the middle and higher latitudes on 23 and 24 June. The probable cause of this activity was several fairly well placed coronal holes.

Auroral activity was generally dormant throughout the last week. Activity was highest over the high latitude regions on 23 June, but was not particularly impressive. It has been sporadically dormant since then.

HF and VHF propagation conditions were normal. Some degradations over the higher latitudes were observed on 23 and 24 June due to auroral-induced ionospheric anomalies, but overall propagation was not seriously affected. Polar path signals have experienced elevated levels of noise. Aside from this, generally fair propagation was observed over the polar regions. There were no significant opportunities for VHF communications this week, although several reports of high MUFs over several European regions were received, permitting periods of long-range communications to be sustained on the VHF bands over these areas. Conditions have since returned to normal.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is on the rise again. At least one active region (and perhaps several) are rotating into view around the eastern limb at this time. Old Region 6659 which produced the magnificent barrage of major flares in early June is due to return back to the eastern limb by about 30 June (any time now). At the present time, very strong calcium emissions on the northeast limb within the vicinity of where Region 6659 should be returning, has been observed. This is also consistent with recent observations of increased background x-ray levels (to near the C2.0 level) and optically uncorrelated minor C-class events.

The return of old Region 6659 is expected to bring increased solar activity. Activity is expected to be predominantly moderate, although occassional major flares will be possible. It is not yet known whether this region will be capable of producing significant major flaring. At the present time, we believe the region has probably decayed to a less threatening configuration. Nevertheless, we believe major flaring could still materialize from this region, particularly if a new burst of flux emerged within or near this region as it traversed the far side of the Sun. However, further decay is likely to be observed as this region transits the visible solar disk over the next two week period.

Geomagnetic activity is expected to remain generally unsettled over the next week. No significant storm periods are anticipated, barring unforseen major solar activity. Geomagnetic activity may begin to increase slightly (to unsettled to active levels) late next week (around 03-05 July). There will also be a slight risk for solar-induced geomagnetic activity by that time.

No significant periods of auroral storming are expected this week, barring unforseen energetic solar activity. Activity should remain confined to the higher latitude regions and should remain sporadically dormant.

HF and VHF propagation conditions are not expected to suffer significant degradations this week. HF communications will likely suffer occassional fading caused by periodic M-class flares. There is chance for a few major HF blackouts caused by major solar flaring and possible solar-induced geomagnetic disturbances, although old Region 6659 is not expected to produce flare activity as energetic as was observed several weeks ago. VHF conditions should remain normal throughout the period. No significant backscatter or other anomalies are expected barring possible major solar activity.

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

786. FD Logging - Just do It

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-28 12:01:35 UTC
From: pescatore_jt%ncsd.dnet@gte.COM
Message-ID: <9106281201.AA28096@bunny.gte.com>
Source record: 295504

Field Day Logging

Not making sure you get the exchange right? - Yuck.

Someone said it perfectly in a previous post: You make sure you copy the exchange correctly because it is the right thing to do. Field Day is supposed to maintain our ability to set up a functional communications system independent of the commercial trappings we take for granted. Communications involves more than pushing the CQ button and copying half of the information the other station might send.

I'm an active contester and Field Day is no more a contest than the Simulated Emergency Test stuff is a contest. And it should not be a contest (whoops, I can hear my old English teacher screaming about starting a sentence with a preposition or conjunctive or laxative or whatever and is). Field Day has the biggest participation of any on the air event in the world and is a yearly opportunity to improve the operating skills of a lotta people. I hate to sound religious (sp?) about this, but studying the FD rules to find ways to ignore the spirit and sneak by minimally compliant is pretty sad.

By the way, I don't think class D stations should be allowed to call CQ in FD. And I was pretty depressed to hear that W1AW went class D, although I think they were answering CQs when we heard them.

BTW**2, FD may be one of the few opportunities for the new code-less techs to get exposed to HF operating. I hope we can all include new guys in our FD efforts and not teach them the "lawyer's approach" to HF operating.

>requirement. Under "REPORTING", the rules say:
>
>Not worrying about logging any times or the other station's
>section or class really made things easier. But it sounded like
>a lot of other stations were going to a lot of extra trouble.

Tad is right about not *having* to keep a log during Field Day. There were a couple of years when I logged right on dupe sheets.

However, even though Field Day is *not* a contest, it is an operating event. The purpose of Field Day is to demonstrate emergency preparedness and to have a good time. Part of demonstrating emergency preparedness is demonstrating that not only can you set a station up but that you can also copy calls and exchange information accurately (just as in a contest, incidentally). Accurate information exchange is a critical part of providing a useful public service function.

Year after year I hear so many lids on Field Day that it is pathetic. I've listened to incorrect exchanges, broken calls, you name it. How can so many people be so deaf? I happen to be gifted with outstanding hearing and the ability to pull very weak signals out of the noise. I operate contests with operators who have similar abilities. I'm not trying to brag, but I find this sort of thing even on FM repeaters where I've heard public service nets (parade coordination and the like) in operation. How can you not understand what someone on a repeater is saying? On HF, under certain interference conditions, I can understand a certain amount of it, but I hear what I think is an inordinate amount. How can we be trusted to pass traffic when we can't get a simple Field Day 2A Santa Barbara right?!

I guess operating contests trains you to pull weak ones out of the noise and to get exchanges right the first time....some of the best traffic handlers I've run across are also well-known top contesters.

Also, I want to echo what John Pescatore (WB2EKK) wrote about so many ops repeating information ad nauseum during exchanges. It is certainly a waste of time....what if you and I were passing Health & Welfare traffic and I repeated *every* piece of info you sent me? Some throughput we'd have...

>The 32S-1 does indeed require an external power supply; the 6146 finals
>require +300, and you need to supply the filament and operating voltages
>for the drivers.
The finals require 800 volts, 250 for receiving tubes and about
minus 75 for bias besides the 6.3 AC for filaments. Collins built
two types of power supplies, the 516 with tube rectifiers and
the PM2 with solid state rectifiers, commonly called the "piggy
back" supply which is the one I much prefer. However, almost any
tube type transceiver power supply for heathkit, swan, galaxy, etc.
commercial or homebuilt will work. I think that a field strength
meter or the AVC meter provides a better final tune "touch up"
since the 6146's are pentodes, not triodes. K9ALD

791. Solar cell array for charging a HT

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-28 14:07:34 UTC
From: buckij@thor.acc.stolaf.edu
Message-ID: <1991Jun28.140734.19201@news.stolaf.edu>
Source record: 295516

Hello All,

I need to find a way to make a lightweight and compact solar array to mount on the back rack of a bicycle to charge batteries for an HT. I have only a very simple question: how?

If this can be done, is it very expensive? does it work well? What kind of output can I expect?

Are there any alternatives? I will not have any immediate power sources available other than the sun and my legs. And I'd rather work the sun than my legs.

Jonathan Bucki
(Ham to be)

P.S. If anyone north of Panama and West of the Mississipi has backyard space for two weary bikers who took a year off a school to do this, we'd greatly appreciate it. We do windows.

792. PK232MBX help needed

Having just purchased a PK232, I have a couple of questions
I am having trouble finding the answer to.

1. Reference is made in numerous places about CWID. This can be
activated by pressing CNTL-F. I cannot figure out where it is
getting your callsign info to send with this command. I thought it
might get it from MYCALL but apparently not.

2. MYIDENT is not documented that I can find. What is it for? I
try to put my call in there or anything else and it comes back
with VVEEEEE when I put in VE3WRN for example.

Please e-mail if you can help.

Thanks,
Randy

In <81472@eerie.acsu.Buffalo.EDU> bowen@cs.Buffalo.EDU (Devon E Bowen) writes (concerning a request that recent French language posters switch to English):
>
>Ethnocentrism at its finest.
>
NO. Ethnocentrism is the belief in the superiority of one's own ETHNIC group or the overiding concern with race. Lingucentrism, perhaps.

>Perhaps these people did keep the posts to
>the only language they could understand?
>I find it hard to understand why
>we have no problem posting in English with
>"world" distributions but they
>are expected to conform to our language
>standards when doing the same.
>Devon

Actually, since the ORIGINAL post that started the chain of French language replies was in English, we must assume both parties are capable of using English for PUBLIC posting. One distinct meaning of the word language is the special vocabulary and usages of a specific group: amateur radio qualifies. Computer professionals (and engineers in general) also qualify. In both these cases, the <de facto if not de jure> language is English. So much so, that very little technical literature written in English is translated into others. IN any case, English is the accepted norm for amateur radio and this (as well as most other) newsgroups. Nothing to be proud of (no ethno or other-centrism) BUT nothing wrong with it either. I read French, some German, and a little Spanish - I don't converse in them (well very occasionally French). I'd be willing to learn esperanto if it could get more universal support. English is STILL the language of choice for this newsgroup.

Anyhow, as I (and other posters) have already pointed out, the French language postings on this thread have had nothing to do with amateur radio. They should therefore either cease, or move that portion of their public correspondance to another group.

Finally, to the original poster: Your question is a good one. I faced it when I entered service in the U.S. Army while the war in Viet Nam was still going strong. I chose to study a speciality (rather than requesting a specific geographical location). That speciality took me then to SEA and later to Germany. I've spent 1/4 of my life outside the continental U.S. and never regreted it. Learning about new places, people, and cultures is one of the reasons I entered amateur radio as well as why I enjoy travel. I hope you enjoy where you end up and what you are doing as much as I did. Bon Chance!

Once again, CT 7.0+ is the answer. We were using home brew software here
also, (running on HP Portable Pluses ;-) and spending a lot of time/effort
supporting it. This year, we took a look at the enhancement list for our sw,
and the features of CT, and switched. CT does have a nice 'window-like'
interface. Hot keys pop-up all sorts of windows giving info about partial
callsigns, multipliers needed (along with a list of section abbreviations)
a band summary, and even a qso rate graph.

CT does not run on the PP's though (surprise!). It does work fine
on other, more compatible laptops, though.

>For now, we've designated one station as "voice" and the other "CW" to
>avoid having to network our loggers. CW is where the points are, so it
>would be nice if the program would warn you that another transmitter is
>on 15m CW. Self-induced QRM is the pits. How do those 24A stations do
>it ?

Well, CT does support linking of multiple computers. (in our case 2).
As the other station logs contacts, they scroll by on your screen, so you
can see what band he's on (and be depressed by his qso rate). There is
also a 'gab' mode. You hit Alt-G, and a window pops up, you type in
a message, and it appears in the gab window on both (all) computers:

Station 1: Hey, we're going to 40 cw!
Station 2: OK, but you'd better refill the generator...

One thing: CT eats COM ports for breakfast. If you want to link
more than 2 stations, N-2 of the computers will need 2 COM ports. This is a
linear network, where the computers in the middle have one port to talk to the
upstream computer, and one to talk to the downstream computer. If you
also want to interface to the radio (change bands on the rig, and the band
automatically changes on the computer) you'll need a COM port for that.
The packet modem interface that another poster mentioned also needs a COM
port. (Not too useful on FD, though). Fortunately, the built-in CW keying
can be interfaced to either a COM port, or and LPT port, so that's what we
used. If you get one of these new-fangled digital voice keyers, that can
be driven from the LPT port also.

In case you missed it, CT is available from:
Bill McGowan
33 Truell Rd.
Hollis, NH 03049

BTW, which group are you associated with? W0DZ by any chance? We worked those guys on satellite, that was a real thrill! (I used to belong to the Loveland club).

>heavy.

>OK, so it takes 5 seconds more on an exchange. If you want to contest,
>don't go to FD :) .

>Perry / AA0ET

I am not opposed to people sending unnecessary information during Field Day for any contest-related reason (see my other FD comments, I am kinda opposed to wasted breath/spectrum/time in general. FD is a good time to improve operating skills, not reinforce poor ones.

Unnecessary repeats DO NOT save time, much the way answering a CQ with only the last two letters of your call DOES NOT save time. There is never a need to repeat the other station's exchange unless you are unsure of what you heard, and you should never repeat your information unless requested by the other station. This is true in most traffic handling, emergency operations, and contests. Have you ever been trying to give someone real time directions on 2M, and listened in frustration as he blathered on while passing the next turn? Similar situation, similar poor operating.

I'm also not wild about the 20 line cartoons many people put on their postings. Similar wasted spectrum/time.

|> >tower.
|>
|> Crank-up towers need guying just as much as standard towers do -- maybe
|> more so.
This is not true, it all depends on how they were designed. Some towers need guys others do not. Adding guys to a tower that was not designed for guys can be disasterous. The load of the guys can do more damage than good. Don't beleive me find a Mechanical engineer and ask him!

|> I believe you can buy free-standing (no guy) towers in both
|> the crank-up and standard variety.
Yes you can, I own a US Tower TXX-455, It is a 55 foot free standing crank up tower, it is collapsed to about 22 feet, perfect for climbing. If you live in California then more of the work is already done since they have UBC drawings and specs that you can use when you apply for a building permit. I did this and got a building permit in 2 weeks! US Tower also makes other models of towers from 35 feet to over 90 feet, all crank up. You can even add a motor
drive if you don't want to spend 15 minutes hand cranking the tower up / down.

|> I am not a fan of crank-up towers.
|> Almost everyone ends up climbing them eventually for some reason (although
|> the tower manufacturers say this is a no-no). They're OK if you are not
|> too in love with your fingers and toes.
It is safe to climb a crank-up tower if it is cranked down. No danger of loosing a hand or foot. Just crank it down. I do this and with a good climbing belt all I have to climb is 22 feet! No problem!

|>
|> I feel it is safer (altho scarier) to just buy a good safety belt and
|> Rohn 25 tower sections and guy it per the Rohn spec. (This is also
|> cheaper than a crank-up.)
I think this is cheaper, but I know this would have been impossilbe at my house. There is no location were I can put the tower and have guys in each direction. This is a problem that many hams face when they live in tightly packed housing area. Also I find it hard to beleive that it is safer to climb a 55 foot ROHN 25 (watch out for those guy wires) than to climb a 22 foot tower. I would have to guess that falling from 55 feet would hurt more than falling from 22 feet :-)

I have been VERY happy with my tower, it went up very easy and is great to work on antennas with (only 20 feet to climb). The tower has taken a 7.0 quake, 55+ MPH wind and is still

standing perfectly straight!

DE KJ6NN
Phil

P.S. I have not association with US TOWER or ROHN. Both companies make good quaility, but different products!

797. Re: Lithium Batteries (was something about th77)

Newsgroup: rec.radio.amateur.misc

This is what the Kenwood TH-27A manual has to say about the lithium battery:

"The memory is maintained by a rechargeable secondary lithium battery. With the battery case removed, the memory is reset to its initial stage after about 20 days. A fully discharged battery will require approximately 10 hours to reach full charge after installing a NiCd battery pack or external power supply."

I assume the TH-27A is similar. So...I don't think you have to worry about having ruined the battery, it should recharge after about a day. Also, someone asked if the lithium battery is rechargeable, and the answer is clearly yes.

If your TH-77A doesn't retain its memory after having given the lithium battery a chance to recharge for 10 hours, then I'd be worried.

Whoa. Time out. The General+ folk were using K9CW's call. We were using
W9YH. So there was no problem with dups that weren't really dups.

The only reason besides that for using a Novice call is so other folk know
they're working a Novice. but since FD rules don't give special credit for
working Novice stations, who cares?

Here's a p.s. to the above note: As I was measuring a couple more AEA "Hot Rod" 1/2 wavelength antennas, I noticed that I could place the antenna flat up on top of a filing cabinet (metal) and it was still resonant at 2m! Then just for fun, I held it so that the full length was within 1-2 inches of the side of the filing cabinet. You guessed it; still resonant and a reasonable match at 2m!

On a not so good note, however, the newer style AEAs seemed to resonate at 143 MHz, while the older one I have is at 146 MHz. The lengths of the rod portions seem to be about the same between the two, so I don't understand exactly what's going on. Collapsing the rod by 2-1/4 inch moves the resonant point to 146 MHz. Think I'll call AEA.

OK, just got off the phone with an AEA technical representative. They claim to hand-tune each Hot Rod using either a reflection bridge or a network analyzer. To tune them, they compress or spread apart the inductor and there is also an adjustable "capacitor" formed by a threaded metal insert down the center of the plastic insulator. This threaded rod also holds the telescoping section. They are willing to supply extra heat-shrink tubing for those who want to "tweak" their own antennas, but he assured me that each one is tuned for 146 MHz prior to shipment. I just wonder if our test setups provide data that correlates? Or do I really have an antenna that is off?

Is there someone else on the net that has a good network analyzer?

Do you mean the permanent club site, or the permanent FD site? If the latter, you should be aware that use of permanent structures for FD is expressly prohibited by the rules (specifically, rule 5).

We can argue til FD92 about logging or not logging the exchange (personally, I agree with the folks who say it's the intent of the rules to log it), but this one's pretty clear cut.

Stand by for a full report on the KH6CTQ/USAF MARS FD effort...are we the only ones on the net who worked K5FD?

Yours for more honest FD efforts,

804. Radio Operators Needed for Soviet Space Experiment

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-28 18:49:13 UTC
From: spgreg@mars.lerc.nasa.gov
Message-ID: <1991Jun28.175155.4703@eagle.lerc.nasa.gov>
Source record: 295523
Cross-posted to: rec.radio.amateur.misc,sci.space,sci.astro,rec.radio.amageur.misc

I have just heard of a proposed experiment to study the plume of a Soviet electric rocket engine. The experiment may take place during the international space year (1992) and will require the assistance of amateur radio operators with VHF equipment. At this point, the researchers are trying to get approval and schduling of the mission. They are working with someone in the American ham radio association. I don't have that name. They have indicated that a broad interest and support for the experiment is necessary to make it useful. If you are interested, you can write to Soviet Agency involved. This may help make the proposal a reality.

Write to:
Research Institute of Machine Building
International Plasma Plume Characterization Experiment
Kaliningrad, USSR
attn: Prof. Victor M. Surikov/ Deputy Director in Science

Please express an interest in participating and include your name and mailing address. The Research Institute will probably not handle all of the coordination efforts, so you should also ask that they forward your name and address to whoever will handle your region.

The experiment is described briefly below. Follow-ups are directed to sci.space.

The goal of the experiment is to map the plume of a Cesium Hall Thruster by correlating the strength of a satellite signal at known locations on the ground. The plume of such a thruster is highly ionized, so it is opaque to radiowaves below the plasma cut-off frequency. The specific frequency varies withthe local free electron density. A reasonably dense plume has a cut-off frequency in the VHF range.

The spreading of the charged particles in the plume is affected by the earth's magnetic field, so predictions are not simple. The shape can be found by examining a signal broadcast from the same satellite that is firing the thruster. The signal can be examined from groundstations. Each station must provide an accurate location and an accurate record of the times the carrier signal is lost or regained. To get an accurate map, however, requires far more ground stations than the Soviets will ever have.

The minimum equipment requirements for the ground stations are a reciever and an accurate clock (sweep second hand). Actually, I expect that the signal will be modulated with a timing pulse, so the clock may not even be required.

805. Shopping for an HF rig

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-28 19:06:20 UTC
From: mojo@netcom.COM
Message-ID: <1991Jun28.190620.6231@netcom.COM>
Source record: 295527

Mornin'. Have some coffee. Pass me a donut would you?

I have a nice check that's about to be burning a hole in my pocket, and my YF (she's still a YL) said I could buy my own HF rig.

For the past several months, I've been using a borrowed FT-980, which is now for sale by the owner (ref. my posting in rec.radio.swap). While it's certainly a fine rig, for a few reasons it's not the radio I want.

My operating style: Almost exclusively CW. Most of my operating is traffic handling and contesting on CW and occasionally SSB. Good QSK is a plus. Good filters is a must, and passband tuning is excellent. Good dynamic range and handling of nearby strong signals (same thing) is essential. A good noise blanker would be very welcome. I would also like to plan for expanding into AMTOR and HF Packet.

Aside from these requirements, I don't really care about other frivolous amenities.

I'm hoping to spend no more than a kilobuck. So a good used radio would be a good suggestion if that's my best value. My dream radio would be one of the Ten Tecs, but I fear they're outside my price range.

It's awfully hard to shop from the ads in the magazines, because they never list prices. I have absolutely no concept of what any of these modern radios cost.

If you know of something you think I'd like, would you please drop me a line?

Many thanks and 73,
Mojo AA4KB

Permanent club site. The University has promised to move us from our existing site (pair of surplus Nike missile launch trailers) to site 530 (real building, with bathroom) within the next few years. We used FD 91 to test the site out for noise and propagation from the hill. The verdict: excellent, although it appears that the obnoxious wideband noise generator on 145.23 will have to be moved. Now if we can only get rid of all of the boxes up there...

For many years, the Oswego County Amateur Radio Association (OCARA) operated field day under the call of John Stone -- W2PGS. We used the phonetics of

W 2 Pretty Good Sex

Stoney became a silent key about five or so years ago. He was the radio officer for the Oswego County Sheriff's Department, and other county agencies. I was a new ham going to school in Oswego, and John helped me trim the crystals for my 2 meter rig when I got my technician. He was always a good friend to other hams. I take a moment each field day to remember John Stone -- Whiskey 2, Pretty Good Sex, 2A, Western New York.

John is still listed in the callbook -- he must have renewed and gotten a ten year license right before he died.

>have a slightly lower loss, and just looks like it should be better.

Also, RG-8/X has a cellular (i.e., foam) dielectric which gives it its light weight and lower loss. The foam is also why the military won't use it -- it probably won't survive being pulled or routed around sharp corners, especially in hot, wet environments. If you use this in exterior applications, you would do well to coat the cable end with Scotch Kote or something similar, and be careful what it rubs against. If it gets slightly squashed in your installation, you can bet that a couple of seasonal temperature cycles will mash it flat. For example, don't slam it in your car door when using a mag-mount or the like.

Of course, these measures are also indicated for solid dielectrics; it's just that 8/X is somewhat more delicate.

Also, while hardline uses foam, it also has a tougher outer conductor, so the military gives it their OK.

As a new reader in this group, I just wanted to voice my support for having French posts -- it is the very reason I started reading this newsgroup. I've minored in French and I'm trying to keep up my comprehension skills, so reading about timely topics in "everyday" French is helping me quite a bit. I don't know how this use fits in with the original purpose of this newsgroup (and believe me, some of the alt.* newgroups get _very_ inflamed when new readers suggest something contrary to the group's raison d'e^tre), but I hope to see both English and French posts in the future.

There. And I didn't even have to bring up American linguistic imperialism (oops, it slipped out).

813. NASA Prediction Bulletin Format

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-28 23:57:27 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9106282357.AA20138@blackbird.afit.af.mil>
Source record: 295524

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

The instructions for crank-up towers that I have seen say this is a no-no.
In fact, some crank-up towers come with prominent signs saying you
should never climb them. The problem is that it is easy to THINK you
have the tower cranked down, when in fact there are a couple inches to
go. Also, I have heard some hairy stories about crank-up tower failure
modes. What do you do if it jams halfway up? Hire a cherry picker,
I guess.

(rec.autos added to Newsgroups: line and Followup-To: changed to rec.autos
because of low radio content of my followup)

For all this talk about going to large amounts of effort to make your car
"stealthy" to include radar absorbing materials, passive reflectors,
and even chaff (just kidding....:-), the fact remains that police radar
is still very dependent on operator skill and data interpretation, let
alone the additional fact that the police don't need radar to pull you
```

over. Pacing you from a car or an airplane, or via new optical techniques work just as well.

As has been hashed out previously, a radar gun doesn't directly measure speeding. What it does is send out radio waves and measure the shift in frequency (Doppler shift) of the strongest waves reflected back, presumably as a result of being reflected off of a moving vehicle. Independent studies of the overall system accuracy of radar enforcement are interesting, but I don't have the exact reference and don't want to post exaggerated numbers (probably around 50/50) as fact.

There was a very good article in the Washington Post Magazine (Sunday Supplement) about avoiding tickets. I forget the issue date or the author, but some very good suggestions went like this:

1. Drive a low-profile, less flashy automobile (this could also save you insurance money). This doesn't necessarily mean a less powerful car. I can attest to that, having owned several nice cruisers that aren't even classified as "sports" cars.

2. Don't attract attention to yourself by making stupid moves, lane changes, significant speed differences relative to other traffic, etc.

3. Let some other idiot drive "point" for you (thus ensuring that any surprise radar will most likely bounce off of him).

4. Keep a sharp lookout, both front and rear. If you see anything remotely police-like (i.e. big, chromeless, with fat blackwall tires and anything on the roof) slow down.

5. If you think you've been "spotted" try the old trick of running with lights off or on, then slipping ahead of another car or truck and changing your lights. You might confuse the officer, particularly if you drive a look-alike econobox.

6. Even if you get caught, all is not lost. If you act VERY deferential (a nice frightened look helps), you might get off with a warning or a very mild ticket.

7. Act very impressed with the officer's radar equipment and ask for a demonstration. In addition to gathering system accuracy information for use in court, this is also an excellent opportunity to check whether he "locked in" your speed. In some states you can almost tear up the ticket if he didn't. An expired radar license or calibration certification, or equipment used inconsistently with that license (stationary radar used while moving and vice versa, wrong band or terrain, etc.) will also not look good in court

7. As always, you can challenge it in court. There is the chance the officer might not show up, or a judge will reduce the charge. In many western states, you can at least get the reckless driving offense dismissed. If you're lucky, the whole thing can be written off as an "energy conservation violation" which doesn't even appear on your driving

record.

Before you flame me, keep in mind the following:

1. Now that the nationwide speed limit has been raised to a reasonable 65 mph, I NEVER speed.

2. I have NEVER been in an accident.

3. The previous advice is for the purpose of avoiding illegal radar traps and other unlawful means of selective enforcement for the sole purpose of raising revenue (which have questionable effects on traffic fatalities) as well as protecting your interests with respect to your driving record and insurance rates.

So put all those brillo pads and rolls of Reynolds wrap away, avoiding police harrassment on the road is mostly a psychological, as opposed to technological, game.

Okay. Attention, all net.users...

YES! YOU! THE ONE WITH YOUR HAND OVER THE "F" KEY! STOP AND [insert favorite vulgarity here]ING LISTEN!

The original article requesting information was crossposted to rec.radio.amateur.misc,soc.veterans, and soc.culture.french.

Several enlightening responses followed. They might have decreased bandwidth if they had been mailed, but c'est la vie (yeah, I know some French too, even if I probably misspelled it, you all know what I meant).

HOWEVER:

Flame wars are bad enough in one group: when inappropriately crossposted, they're a pain in the patookus.

Posts in French are appropriate to soc.culture.french, but of limited value elsewhere.

Anti-militaristic harangues, especially in French, were a waste of bandwidth with a world distribution to soc.veterans.

Both items were as if not more useless in rec.radio.amateur.misc.

The point being, check the Newsgroups: line to see who your audience is.

If you want to flame me, do it by mail. Don't make paying users waste
their money on more senseless drivel.

>Phil
>

I have had the 38' TX-438 version of the U.S. Tower up for several years and I am very pleased with it as well. It fits easily in a tight space and is self supporting. As I hate climbing, I purchased the tower raising fixture (tilts at the base). I can crank it down and tip it over unassisted, though I make sure someone is standing by in case of unexpected accident. I usually prop it on a ladder and service it and the antennas from the ground at my leisure. On a 12' foot mast, a 10-15-20 tribander, 6 element 6 meter beam, a pair of 11 element 2 meter beams sit, with a ringo to Ringo to top it off. It's very steady in the heavy wind and thunderstorms we have in the Chicago Area. The tower raising fixture is a real joy, as it attaches to the same baseplate as the tower and comes off when not in use. The cranks are automatic, load actuated brakes and are easily to locked to inhibit unauthorized access.

I don't recommend this myself, but I do notice that U.S. tower sells
a service platform for the top of their towers. If you mark the retracted
position of your tower segments when you install it, you probably can be
assured that its retracted. But then again, Im not going to try it.

> -Paul
>

Which is precisely why the site administrator, Devon Bowen, wants you to use the alias ftp.cs.buffalo.edu which is updated on their name server to whatever host has the current ftp files in case one goes down or they just want to switch. Currently it's aliased to hadar.cs.buffalo.edu

Again, the archives are on ftp.cs.buffalo.edu, armstrong going down will not affect this.....

Incidentally, this is also why you should use callsign.cs.buffalo.edu 2000 and not marvin.cs.buffalo.edu 2000 for the callsign server. Marvin is still up (last time I checked) but they may want to use the computer for something wierd, like academic uses....:-)

ACM005@zeus.unomaha.edu

820. Monthly Elmers List Info and Administrivia

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-29 06:58:56 UTC
From: acm005@zeus.unomaha.edu
Message-ID: <17137.286bdb50@zeus.unomaha.edu>
Source record: 295547

A Brief Historical Overview:

If there is any one constant in the changing state of the communications art, it is that "hams" have always been on the forefront of it. Whether the word HAM originated with the acronym "Home Amateur Mechanic" or from the Cockney pronunciation of "L'amateur", or of the initals of the founder of the American Radio Relay League Hiram A Maxem, or some other obscure source, it is universally recognizable as describing one who experiments in radio and communications. Whether it be constructing a low-power CW radio with vacuum tubes, or designing TCP/IP packet networks, such experimentation has historically spilled over into the mainstream with ham-originated technologies like AM, FM, and Single-Sideband, as well as ham-perfected technologies like packet radio.

Since in many cases hams are writing "the book", there is often no "book" or other established reference for a beginner to refer to. Traditionally, information has been passed on from ham to ham via word-of-mouth. Like many of the traditional crafts, a variation of the Master-Apprentice system has emerged, the Elmer-Novice relationship. Called "Elmers" because they are usually older and wiser, having the benefit of many years in the hobby, including several failed projects, and an electric shock or two, they have traditionally been the mainstay of the hobby, and the source of many new hams, particularly those interested in working on emerging technologies.

What is an Elmer today?

An Elmer today is of any age, male or female, who has some expertise and is willing to share it with beginners. Elmers don't even need to be licensed amateurs, just people with knowledge in some area of electronics or communications technology.

What is a Usenet Elmer?

With the ever-widening scope of the Internet, and the amateur radio newsgroups on Usenet, the potential for Elmers to share their information to a wide audience has never been greater. To that end, I have started to maintain a list of such Elmers. Volunteers need only send me their name, E-mail address, and area of expertise.

Naturally, the more that volunteer, the more the work is distributed. If upon volunteering, you are unable to meet your obligations, simply write to me and I will remove your name from the list. I could also add that because of "personal committments" or "career broadening" you

no longer are available to Elmer on a regular basis.

I will be the point-of-contact for this project. I will maintain the list, post it to the groups on the first of each month, and have the latest copy placed in the supplemental archives at ftp.cs.buffalo.edu in subdirectory pub/ham-radio.

The latest version of the list can be found in the companion posting to this message, "Monthly Usenet Elmers Resource Directory." If you sent me mail and are not on it, please resend as it may have been lost on the way or once it reached my host.

Currently, the list is over 27 Elmers strong, has been featured in informational postings in the comp.archives and news.announce.newusers postings, and has become an invaluable resource for many. Thanks to all the volunteer Elmers, as well as courteous list users, for making this service a success.

de NA4G, "Boat Anchor Bob", an ol' cw fart .....

If I can be of assistance in older equipment, junk-boxing
your way to hamdom, the cheapskate's approach, let me
know.

22 yrs a ham, extra class, mostly cw, mostly boat anchors
and radio in the traditional sense.

{Telegraphy has been in my family for almost 100 years!}

I'll be glad to help out with tube circuits and VE testing.
(W5YI VE# 3182)

I can provide advice & assistance to any hams (or prospective hams) who
might be interested in things like reciprocal licenses, the differences
between European and USA Bandplans/operating practices etc.
Similarly, where to go in Britain to take ham tests, how to get information
on joining RSGB or local radio clubs, details of hamfests/swapmeets etc. over
this side of the pond...
Also advice on old tube-type radios (from the 1940s to the 1960s) and
'low budget' radio - converting commercial VHF 2-way dispatcher radios to
work on packet etc.

* SpaceNews 01-Jul-91 *

Bulletin ID: $SPC0701

=========
SpaceNews
=========

MONDAY JULY 1, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* SHUTTLE NEWS *
================
Preparations are underway for the launch of US Space Shuttle "Atlantis"
(OV 104) on mission STS-43 in this month. Atlantis is currently located
on launch pad 39-A at the Kennedy Space Center in Florida. Mission STS-43
will deploy the tracking and data relay satellite TDRS-E from Shuttle
Atlantis.

A helium signature leak test of the main propulsion system and a test of
the three main engines was scheduled for June 28th. Payload to orbiter
interface verification tests were planned for the 29th, and a terminal
countdown demonstration test will take place on July 2nd and 3rd.

* UoSAT-2 NEWS *
================
Here is a recent UoSAT-2 On-Board Computer (OBC) status report:

* UOSAT-2 OBC STATUS INFORMATION *

DIARY OPERATING SYSTEM V3.1 SMH MLJM MSH

Today's date is 29 /6 /91 (Saturday)
Time is 0 :50 :10 UTC
Auto Mode is selected
Spin Period is - 304
Z Mag firings = 0
+ SPIN firings = 140
- SPIN firings = 80
SEU count = 1502
RAM WASH pointer at D07D
WOD commenced 29 /6 /91 at 0 :0 :8

with channels 10 ,11 ,19 ,29 ,
Last cmnd was 109 to 0 , 0
Attitude control initiated, mode 1
Data collection in progress

In addition to this status report, UoSAT-2's telemetry report indicated
a total of 7 primary OBC errors and a total space dust count of 166
during the 4.84 second telemetry sample period. These values are higher
than "normal" and can probably be attributed to high solar activity.

The space dust experiment is similar to what was flown on the GIOTTO
spacecraft and was built by group of students at the University of Kent,
England. It uses a dielectric diaphram which, when punctured by a large
particle, discharges the capacitance associated with it, thereby indicating
the impact. This works in conjunction with a piezo electric microphone
which detects particles of a smaller size.

>on 145.23 will have to be moved. Now if we can only get rid of all of the
>boxes up there...

Hey Paul,

Get rid of the Big Dish on site 522 as well; it's a real eyesore :-).

I used to work at 522 almost everyday for a few years when I was with
the Radar Astronomy group at Stanford.

So, how do you give members of YX access to the field sites? Used
to require card access to drive up there (and I remember using keys
before they installed card access in about 1975). Since Stanford
has always been very sensitive about the rapes that occur up there,
are they really going to issue card-key access to YX members?

Speaking of QRM, I would imagine that W6YX is considered to be
QRM by the SETI crowd. :-) That's what I did before leaving Stanford.
Couple of Hams in that group, wonder if you know Cal Teague.

Typical ARRL propaganda that has nothing to do with the truth. AM and Single-Sideband were developed and put into service long before amateurs even knew what the words meant and FM was the brainchild of Edwin Armstrong, hardly your typical ham.

828. MAJOR SOLAR FLARE ALERT - 30 JUNE

Newsgroup: rec.radio.amateur.misc
Date: 1991-06-30 05:16:16 UTC
From: oler@HG.ULeth.CA
Message-ID: <910629231616.21c000cb@HG.ULeth.CA>
Source record: 295429

-- MAJOR SOLAR FLARE ALERT --

JUNE 30, 1991

Flare Event Summary
Potential Impact Assessment

MAJOR ENERGETIC EVENT SUMMARY

Several notable events have occurred over the past several hours.
Perhaps most noteworthy was a low-level major solar flare which began at
02:41 UT, peaked at an x-ray class M5.0 level, and ended at 03:14 UT on 30
June. This event was accompanied by a short tenflare (6 minutes in duration)
and was not optically correlated. It is suspected the event occurred beyond
the east limb within the vicinity of returning old Region 6659. This flare
was also accompanied by a Type IV sweep.

Old Region 6659 has not yet rotated into view, but should do so very
shortly. Low-level C-class flaring has increased in frequency over the last
24 hours. Background X-ray levels are also above the C1.5 level.

An interplanetary shock was observed at 01:16 UT on 30 June. The
associated sudden magnetic impulse was measured to be between approximately
30 and 40 nT.

Proton levels have also been increasing over the last 24 hours. At
approximately 00 UT on 30 June, proton levels began to climb more rapidly as
the interplanetary shock approached. Proton levels surpassed event threshold
values of 10 pfu at greater than 10 MeV on 30 June at 02:30 UT on 30 June and
are presently hovering near the 12-16 pfu level (as of 05:00 UT on 30 June).

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

This last class M5.0 flare is not expected to have a terrestrial impact.
However, as the region responsible for these flares rotates into a better
position over the coming week, the risk for potential terrestrial impacts
will increase, provided this region maintains a suitable flaring
configuration.

Geomagnetic activity over the next 24 hours is expected to become
unsettled to active as we experience the effects of the recent interplanetary
shock. A few periods of minor storming may occur over the higher latitudes,
although nothing particularly significant is expected to materialize from
this event.

High latitude auroral activity is expected to be mostly moderate during the local evening hours of 30 June/01 July. Sporadically localized areas of high auroral activity associated with substorming may also be observed over the higher latitudes. No widespread auroral activity is expected. Northerly middle latitudes should witness generally low levels of auroral activity with possible periods of moderate activity.

HF propagation conditions will be generally good over the low and middle latitudes. Some increased levels of fading and distortion can be expected over the northerly middle latitudes to central middle latitudes over the next 24 hours. No serious degradations are expected at this time over the low and middle latitudes. High latitudes will suffer the worst conditions. Auroral flutter and associated radio anomalies can be expected on the evening of 30 June/01 July. No significant degradations are expected, although generally fair to poor propagation conditions can be expected during the local night hours over the high latitudes. Polar path signals will become noticably degraded due to signal passage through the disturbed auroral zone.

There is only a slight chance for VHF backscatter over the next 24 hours. No significant opportunities are expected if this disturbance remains below storm levels (as it should).

** End of Alert **

Shh! We've almost got all the newcomers fooled! :-)

To soothe offended sensibilities, I will edit my post next month to be more in keeping with historical accuracy and point out that most technologies were more ham-tested and developed rather than "invented." Gotta keep those patent attornies happy.......

And could everyone please do me, the net, and the Elmers List service a favor and not turn this thread into a big flame war a la USAF Mars and NoCoders, Free French vs. the Vichy Hams, etc.? (followups directed to alt.flame if you can't resist)

--

Paul W. Schleck, KD3FU

ACM005@zeus.unomaha.edu
ps67@umail.umd.edu

/ Albert Einstein, when asked to describe radio, replied: "You see, wire
/ telegraph is a kind of a very, very long cat. You pull his tail in New
/ York and his head is meowing in Los Angeles. Do you understand this?
/ And radio operates exactly the same way: you send signals here, they
/ receive them there. The only difference is that there is no cat."

I agree. Americans are usually fairly ignorant of other languages
(unfortunately). I wish that our schools really forced us to learn a second
language fluently. Alas, that hasn't happened. While I'm far from fluent
in French, I've been able to wade through it and translate it to English...
It's actually kind of fun.

>I speak English and can read C, Pascal, FORTRAN, and a little French and Assembler.

Hehehe...you're right along with me...almost perfectly...

1 Maybe those jokers who keep trying
to dream up "phonetic cartoons" of
themselves don't much care if the
ops on the far end get their calls
right

2 for Field Day I guess it doesn't much
matter anyway.

3 The standard phonetic alphabet works
fine.

4. Variations lead to repeats and errors

5 But the majority of the FD operations
I heard this year were quite similarto
other years - generally quite poore,
repetitious, inefficient.

6 Maybe that's why our group, which is far
from being a high-power coutest group,
consistently comes in at or near the top.

7 We at least try to do a good job.

8 How about the phonetics I heard being used
on F.D. a few years ago by K4FU?

9 The best comment I heard about it was he
couldn't even spell right!

RACESBUL.176 DATE: July 1, 1991
SUBJECT: Equipment for emergency responders - Part 4

You may wonder how big your pockets will have to be to carry
these things. I use a fanny pack or, as some people call it, a
belly pack. It is basically a belt with a pouch attached and
made of nylon. Mine has three compartments -- a large central
compartment that will hold my camera, speaker mike, boom mike,
spare rubber duck antenna, and other miscellaneous items. It has
outer compartment, which is smaller that the central compartment,
I use for my spare batteries and battery pack. The inner
compartment is next to the belt and is ideal for your diary or
small note book. All compartments have zippers. They can be
bought for less than ten dollars.
Always have drinking water available with a reserve supply in
your vehicle or other storage area at your site.

THINGS TO HAVE AVAILABLE:

Always carry a warm jacket in your vehicle. Even in the
summertime it can get quite cool at higher elevations.
Carry plenty of clothing. A good rule is to carry twice as
many changes of clothing as you think you will need.
Carry a blanket or, better yet, a sleeping bag.
Carry food that does not need refrigeration. I carry granola
bars and canned pork and beans. Be sure to have a can opener.

(By Les Ballinger, WA6EQQ. To be continued.)

-- MAJOR SOLAR FLARE ALERT --

JULY 01, 1991

Flare Event Summary
- No Significant Impact Expected -

MAJOR ENERGETIC EVENT SUMMARY

A major class M5.8/1N flare erupted from new Region 6703 early in the UT day of 01 July. The event began at 01:24 UT, peaked at 02:40 UT and ended at 03:27 UT on 01 July. This long-duration event was located at N33E79. It was characterized by a slow rise and fall in x-rays and was not associated with any sweep frequency events. The radio spectrum was also relatively weak. No significant bursts were observed from this event.

New Region 6703 is the return of old Region 6659, which spawned a number of very powerful solar flares. It is unclear whether the entire region has rotated into view now. It is too near to the east limb to discern any significant detail, although Calcium XV observations still show strong emissions from this Region. Region 6703 is located at approximately N30E72 and will rotate into a progressively better position for analysis and observation over the next couple of days.

Please note the following correction. The last major flare (class M5.0 at 03:02 UT on 30 June) was not an east-limb flare. It was located within Region 6693, at a position of S06W19. It was an optically important 1N flare with a respectable 245 MHz burst of 77,000 sfu (10.7 cm burst was 1,400 sfu). No significant impacts are expected from that event, as was reported.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

The last major class M5.8/1N flare is not expected to have a terrestrial impact. However, major flaring from Region 6703 is expected to continue. Judging from the previous history of this region, it is not unreasonable to expect potential isolated major X-class flares from this region. However, that is still to be determined. This region is still too near to the eastern limb to discern any significant details. More will be known within the next 48 to 72 hours.

Occassional major flares can be expected over the next several days at least. Region 6703 is the most threatening candidate for major flaring, while Regions 6693 (S06W34) and 6699 (N12E32) will likely contribute isolated M-class flares over the next several days. Region 6699 is developing increased magnetic complexity and is growing in size, but is still a

relatively small region.

The satellite proton event continues in progress at the present time. Protons have levelled off (for the moment) at around 20 pfu at greater than 10 MeV. A slow decay may have commenced and may continue if proton levels are not enhanced again from further energetic flaring.

Polar latitudes have experienced increased absorption over the last 24 hours due to the increased proton levels. Complete absorption has not occurred and is not likely to be observed provided further major flaring does not inject additional protons into the polar regions (this will be possible throughout the next week). Most other latitudes have had good propagation conditions.

Geomagnetic activity is expected to remain generally unsettled to active over the next 24 to 48 hours. Brief periods of minor storming may be possible over the high latitude regions. No significant activity is expected.

** End of Alert **

834. APT-Sats: Status JUNE 29, 1991

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-01 07:49:21 UTC
From: henne@eana.f3.gmd.dbp.de
Message-ID: <5036@gmdzi.gmd.de>
Source record: 295555

Observed at station 50.7 NLat, 7.1 ELon, JUNE 29, 1991

NOAA-9: APT 137.62 *OFF*
NOAA-10: APT 137.50 On
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 On, normal vis- and Th-IR- channel
METEOR 2-20: APT 137.85 On, normal signal with burst etc
METEOR 3-4: APT 137.30 On, vis during day, Th.IR during night

OKEAN-3 transmitted an APT-image 137.40 MHz during N-S-pass over
northern USSR, combined 8mm microwave-scanner + active radar.
I wonder if these oceanographic sats are active outside europe.

No other APT was observed 136.00 to 137.99 MHz 6.00-17.00 UT

My 2 cents worth.

If one looks at a 5/8 antenna on the roof of a moving car, it bends! This must lilt the plane of max radiation - some goes up and some goes down onto the road. I've found that 1/4 wave, being stiffer, gives almost the same performance as a 5/8 with the advantages of a compact design.

Hello,
Because I'm not yet a member of ARRL, nor do I have any friends who are hams (*sigh*) I don't have access to QST which, I am told, would contain an add for Solvonics. Could someone please send me they're address?

Also, if you know of any other suppliers of good solar cells and related equipment, please let me know.

Thanks Much

While I think this is a great conceptual idea, I think it will inevitably
butt heads with those that think that the current rec.radio.* heirarchy
is necessary and complete and don't want to see topics of interest spread
all over several newsgroups. Currently, rec.radio.shortwave discusses
"DC to light" and should remain so.

I still think that such a group could be accepted under the alt.*
heirarchy for the following types of postings.

1. Anything regarding pirates clandestines.

2. Anything regarding "free-banders" on 11 meters (above CB).

3. Anything that doesn't quite fit under rec.radio.* or would be
flamed if it appeared.

Who knows, maybe if such a group is created, it will fall under the
"restricted access" policies of UNO (where you have to agree to a
statement of understanding freeing UNO of any legal responsibility for
content) like alt.sex or alt.drugs....:-)

Randy,
International Radio Co. has a user's newsrag for Kenwood (Icom & Yaesu, too) radios. I used to subscribe when I first bought my 940. I implemented many of the "mods" in my set. Such as: improved talk power on SSB, bypass of linear amp relay thru QSK FULL/SEMI switch, improved sensitivity on 500kHz - 1500kHz band, gn'l covergae xmit, etc. They sell back issues of the rag for a fair price. They also have a catalog of back issues broken down by make, model and subject.

As of this writing (Monday morning) I don't have the address handy. But, I'll tell you what I'll do. Tonite I will find their addr and mail it to you tmw. I have the back issues for the Gn'l coverage mod and many more. My collection is abt 1.5" thick, though, and it wud be a pain in the gool to copy all of them. 73 - walt - k2wk...

|>That usually takes less time than in the long run since the big overhead
|>is in the turnaround. I've had to turnaround four times when the QRM is
|>heavy.
|>

I have to admit to doing it as well -- every operating event seems to have its own customs and I try to follow them because it's faster to be regular than "right" (when in Rome....) But I have one exception -- if we worked the station before, I don't repeat and only send my exchange once. My assumption is that they have computer-based logging too, and they already know what I'm going to say (just as I already knew what they were going to say. Well, usually -- we did have one operator who made up exchange info when he didn't hear it the first time. Another one of these "you don't really have to log it" guys.)

The original commercial SSB installations used very accurate (like a few Hz) fixed-frequency point-to-point links. I believe it was the hams who first showed that SSB would work with tunable radios.

And didn't Edwin Armstrong consider himself a radio amateur?

From: holly@hpcupt1.cup.hp.com
Message-ID: <73190023@hpcupt1.cup.hp.com>
Source record: 295428

I have a HF2V that I am putting up for use on 30, 40, and 80 meters. In reading over the tunning instructions, the use of the "Top Hat" loading to increase the bandwidth on 80 meters seems like a good idea, but Butternut says it should not be used if the 30 meter resonator is used.

Question: Would using a 30 meter trap on the top hat wires isolate the top hat on 30 meters and still allow the top hat to be effective on the lower frequencies?

Has any one done this sort of thing?

Any comments would be useful...please keep the laughter down to a small chuckle.

Thanks,
Jim, WA6SDM

850. Ramsey 2m rig

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-01 21:08:58 UTC
From: stevew@wyse.wyse.com
Message-ID: <3212@wyse.wyse.com>
Source record: 295569

Hi All,

Well, I finally finished off the Ramsey 2m rig this weekend that
I bought at Dayton. Thought I'd mention a couple things I discovered/
changed along the way.

I found that the receiver wasn't even close to the specs. The problem
was in the receiver input tank circuits...they were way off resonance.
The two tank circuits used the little pre-formed 0.04uh coils that
are prevalant in the kit. The sensitivity with these coils was measured
at about 6uV best case...thats quite a ways from the .35uV spec! This
wouldn't have been any problem if I'd needed less inductance...turns
out I needed alot more! The fix was to replace these with two
variable inductors I got from Digikey. The receiver is now performing
at about 0.5uV which is more than enough sensitivity. So fair warning...
The rig will turn on and play, but it may not hear nearly as well as it
is capable of doing. A real signal generator is a must for actually
getting the rig to work at its' best.

Beyond some basic building errors that were all my fault ;-) the
other item I think everyone ought to look into is the harmonic
content of the transmitted signal. I tuned up the transmitter
per their instructions and had some problems. The first point was
that the inductor (L17 I think) between the driver stage and
the final should probably be smaller than it is. I was loosing
all the RF into this guy and not getting any power into the final.
I took off one turn from the coil and this seems to do the trick.
The driver stage also had some problems...if the driver stage
is too hot for you to touch it, then you have the same problems.
The heat is a bad sign, and actually has a direct correlation to
the xmtrs harmonic content(i.e. the strength of the harmonnics)
I found that where I had to lessen the inductance between the
driver and final, the inductor feeding the driver needed to be
shoved tightly together. I wound up adding a turn to this
inductor to get the best performance. Before I made these
adjustments the harmonics of the transmitter were only 30 db down.
After making the adjustments the harmonics are 45 db down
from the fundamental(and now legal ;-) Point being that if you
have access to a spectrum analyzer, it would be advisable to use
it as an indicator of how well the radio is performing.

I had a good time putting the kit together and have some plans
to tie it in as a remote base for my 220 repeater...should be
more fun ;-)

I'm curious if anyone else has stuck the radio on either a
sig gen, or spectrum analyzer, and what the results were?

>Please, share with me and others how you learned to copy CW faster
>while enjoying it more.

First, welcome to the net. You must be a new reader because we had this discussion a short while ago. There were some useful suggestions, but of course it degenerated into "CW is old-fashioned" - "No it's not" - "Yes it is".

My answer to your question is that you should keep using CW, and you'll get faster almost without noticing. Write the stuff down if you feel happier doing that, eventually you will realize that it's just a waste of pencil lead. But I do still write some of it down, in the same way I write a few notes if I'm having a voice QSO, to remind me of something to say on the next over.

I don't think anyone started out being able to copy 30+ wpm, I'm at about 35 - my copying and my writing run out at that speed. I'm still trying to improve, but not worrying about it. If you enjoy it, it will come. And it's not old-fashioned :-) Well, OK, maybe it is, but it's fun, and it's more challenging than shouting into a microphone, so there!

The W1AW practise sessions are very good for increasing your speed, at least they send decent CW. One of the less pleasant challenges is trying to copy 15 wpm stuff that is badly sent.

Good luck with it, and have fun - it's only a hobby!

Here is some more info from an article in the NY Daily News of 6/20 and from inside info from an officer who was in on the arrest. He phoned in to a radio talk show after I had read the news article.
The 2nd person was a David Yung, 23. Both were charged with transmiting illegally over an emergency frequency, according to the news. Another paper said it was interfering with government administration. According to the police officer the crime is a violation of State and local laws as well as the FCC regs.

The motive according to the officer was revenge on the local precinct where they had a run in with local officers, he gave no other details. The two, he continued, figured how to run their station by reading the manuals included with the equipment. They were caught because they had no concept of how a repeater works. The NYC repeaters are interconnected & sync'ed. Get picked up on one and you're al over the borough or city, depending on what channel. It was easy to isolate the area and then DF to their apartments on Columbia Street, just north of the Williamsburg Bridge. Ironicly, I live just South of the same bridge!

He had no word as to wheater or not they were suspect in the theft. Accoring to the Ham Radio Newsline, two jokers were trying to sell hot equipment at a hamfest 2 weeks before, the local Maine cops couldn't prove it was the loot from Barry's. It looks like it could have been them.

853. Re: Solar cell array for charging a HT

> I need to find a way to make a lightweight and compact solar array to
> mount on the back rack of a bicycle to charge batteries for an HT. I
> have only a very simple question: how?

Buy some solar panels and hook 'em up. The hard part is finding the right panels... which type? You can get crystalline or thin film (not as long lived but apparently cheaper and more (?) efficient). What form factor? What type of packaging?

And then there is the electrical match. A solar panel at full light intensity can be run anywhere from shorted (near zero E, reasonable I) to open circuit (maximum E, no I). There is a point on the E/I curve where EI (power) is maximized for a given input light level. Ideally you want this point to be where I (current) is about right for charging your NiCads when E (voltage) is about the NiCad output level plus 1-2 volts. That is, the charging level, allowing for a diode (if not already built into the pack) to prevent back discharge.

You might have to shop around. I bought a pair of MSX-01 units from a local contractor called Remote Power (which usually deals in much larger quantities, to businesses). They were "seconds" -- not top performance -- but small, light, nicely packaged in a plastic frame, about 6" square. They put out optimal juice, about 60ma at 8.5V or so, for charging some Yaesu FNB-17 packs (600mAh, six cells). Or was it 110mA? I forget. Something in that range. I don't recall because frankly I don't use them much. Nice toys to have around in case I need them...

> If this can be done, is it very expensive?

I think I paid $25 apiece.

You might also consider a system that (somehow) draws charging current from a wheel only while coasting downhill. The hard part would be mechanically disconnecting the generator while you are pedalling and reconnecting it to the tire when you start coasting.

854. Rejuvenating cooked NiCd cells - war stories?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-02 05:27:20 UTC
From: obrien@aero.org
Message-ID: <1991Jul2.052720.22656@aero.org>
Source record: 295573

Several reports have appeared in this newsgroup relating
the rejuvenation of overcharged, cooked NiCd cells by injecting them
with deionized or distilled water with a hypodermic syringe. Well,
I'd like to know two things:

1) How do you go about injecting a metal-cased battery
without snapping the needle off?

2) Where, in these drug-maddened days, can you lay hands
on such a highly illegal and restricted piece of hardware as a
functioning, metal-tipped hypodermic syringe?

Actually, I can see it now: "Hi, I need to buy a hypodermic
syringe and several nice big steel needles for it. And oh yeah, how
about a gram balance while you're at it, to weight the batteries and
find out which ones are light and need water? Er, hello? Hello...?"

> alot of TV time since it is an easy target. If the 911 system was so bad the

The cellular telephones have more problems here than the hams. There
are three systems in the Dallas/Ft.Worth area and at first they would
not transfer across those boundries. Neat to be in downtown Dallas
trying to get an ambulance and the 911 operator you reached in Ft. Worth
wants to know how you are going to pay the long-distance charges. The
hams have patches in both areas so only DFW airport would be a problem
(the third system covers only the airport). There seem to be some
agencies which have problems transferring to others but most of the
fire/ambulance agencies have a policy to take the info and call the
proper agency for you.

911 is better than not have it but it's main purpose is to make money
for the phone company. I get a charge on my phone bill for 911 but I
don't have 911 service!

857. Bearcat 220

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-02 11:09:12 UTC
From: phn@dde.dk
Message-ID: <1991Jul2.110912.22780@dde.dk>
Source record: 295432
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

I am the happy owner of an old Bearcat 220, and I have a couple
of questions regarding this scanner:

Is it possible to make the unit scan all 20 channels at power up
instead of the first 10? When used mobile, it's annoying
to have to push a button every time the car has been started.

The delay function seems to count down on the delay time. Thus
after a few change overs or signal drop outs the scanning will
continue even if all periods without signal have been less than
the delay value. Is it possible to make the unit always delay
the expected time regardless of the number of short periods
without signal ?

Is it possible to increase the delay value ?

The model I have is the european version with 66-88 Mhz coverage
instead of 30-50 Mhz. However the logic seems to be the same, as
I can program in frequencies in the 30-50 Mhz region, but it
does not seem to receice anything. What modifications are needed
to enable 30-50 Mhz receive (I still want 66-88 Mhz, as this
area is used i Europe).

Where can I obtain a service manual? I am living in Denmark
where scanners are illegal, so there are no stores selling
scanner equipment here. I could go to Sweeden, but I doubt
anyone there carries information on the Bearcat 220 any more.

Thanks in advance
Per

|>

One of the things that helps with "head copy" is learning the customary phrasing used on CW. Once you hear it enough, "TNX FER CALL" or "UR RST 5<#>9" you begin to hear them as words rather than as collections of letters. There's a cassette called "QSO Master" (I've seen it advertised in QST) that drills you on phrases -- I can't claim it has made me a CW star, but it certainly helped me relax a little bit when copying. It would be an easy thing to rig up with a code practice program too.

Hi Jeff, I'm not a real whiz-bang on this but I believe SCA is FM Sub Carrier Audio. In the Radio Shack semi-conductor reference book (a couple years back) was a complete circuit for receiving SCA.

>>Has anyone else experienced the following?

My own bit of TH-77A weirdness was this week: The internal speaker (only) went nearly dead. The external speaker port worked fine, and the internal one gave a _little_ noise. I looked at the schematic and incredibly, there are separate amplifier dhips for the two; the shorting jack for the external speaker is another soft switch that tells the microprocessor which amplifier to enable. Very strange.

I was ready to send the rig back to Kenwood for warranty work but I decided to call and ask for advice. The extremely friendly rep (who even called me back, since he was busy when I called) said "oh, yeah, that happens. Reset the microprocessor."

Sure enough. I lost all the memories, but the audio is fine.

Great rig.

He told me the TS450 will be shipped in a few weeks, by the way, and that the features are much different from the 440.

You're on the right track - putting the pencil down after jotting down a
few QSO particulars is the first step. Eavesdropping on QSOs at speeds
just a **little** above your abilities is good practice. And W1AW code
practice sessions are very valuable too. In real QSOs, its good form to
tell the other op what you're doing and warn him that you might have to
ask for repeats. Most cw ops are very accommodating in this respect.
Note: I'm not a "wizard" - 35 wpm is just about my limit for rag chews,
with 30 wpm being a much more comfortable rate. At these speeds, I just
close my eyes and watch the words scroll by on the back of my eyelids.
The **real** wizards are the 40+ wpm ops. I've no idea how they do it.
I can't even **think* that fast :-)

A similar situation to the one Troy described happened here in NY.
My friend Jack N2JNT, sent in for his call plates (here we can keep our regular plates
until the call plates arrive.) after many months of waiting
they returned with the whole call jammed on the edge of the pl;ate..
In New York the custom plates have the statue of libertyon the far left
so with his call all the way on the right it looked well ... funny.
So he calls the DMV to find out exacty what happened and the lady says
"Thats been happening a lot lately, lets order a new set for you .. and
she does.. then just 3 weeks later the new set shows up .. he goes down
to drop off the off-centered plates and they are like.. "Keep em."
So he decides to leave the off-centered ones on the car and now he has
a nice set for the Shack!

>the same time.
>
>The problem is synthesized radios. If either one of the two radios
>(on the same band) is synthesized, BOTH radios will be susceptible
>to interference due to the phase noise in the synthesized radio.
>
The problem we had with radios getting into each other was not
even band related, the group that comes out for field day has many TS-440s
as they are small and easy to handle in FD. The problem being that everyone
could hear the other 440's operating no matter what frequency you were on!
This lead us to believe that it was IF leakage from rig to rig.. on both
SSB and CW every band and mode each 440 op could hear the other two almost
exactly on frequency.. it was most disturbing!!!

This is tyhe only time we use 440s and I am wondering if anyone else has
had the problem. During W2SZ/1 the contest group uses a myriad of rigs
multiple 930s and 830s as well as a smattering of ICOMs that change from year
to year, oh wait and a 940 too... (each rig operates on a different band
as an IF for the Transverters.. 6m on 21M, 2m on 28M, 220 on 14M etc.)
and we never have any pproblems (I mean this cross-IF? problem.. Murphy
seems to show in other areas, like the 2m amp and rig that the guys in the
six meter truck smelt smoke and went over to see the 2m op in his truck
looking very POed at a smoking setup.)
Also during FD (3A - 3 440s, 2 830s , we switched one of the 440s out of the
loop and operated one SSB and one CW.. and tried to live with it.)
There were no problemns with the 830s at all...

Source record: 295434

There are a number of good antenna manufacturers, also some bad ones. But try to get an antenna with a "NMO" (new motorola) mount. Larson, Celwave, AS and Motorola are some of the users of this style mount. By using this mount you can interchange antennas of different manufacturers just by screwing them off and on. I have both a roof top mount (3/4" hole) and a mag mount. The hole is no problem. The first time is the worst, after that it is painless to poke the hole in any new car. Even your BMW.

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 017 (OPDX.017)
July 1, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, ARRL DX Bulletin, WK3N, K8BL, WB8HIW, N8HUR, K8YSE and W8ZD the following DX information.

3X, REP. OF GUINEA. Carl, N8HUR, received his 3X1AU QSL with a note on the back of card. The note was from the QSL Manager ON6BV stating that the documentation for 3X1AU was sent to the ARRL on May 5, 1991. For those who need DXCC credit for 3X1, KEEP YOUR FINGERS CROSS (KYFC). By the way, ON6BV is also QSL Manager for 3X1SG.

9V, SINGAPORE. There have been plently of 9V stations this week operating on CW. Activity has been mainly long path 10 to 30 KHz on 20 meters between 1030 to 1130Z. Look for 9V1JY, 9V1XQ, 9V1YC and 9V1YR.

JY, JORDAN. Paul, W8ZD, had a QSO with Ray, JY9SR on July 29th. Ray said he will be going QRT in two weeks. In the meantime QSL via Box 354 Amman, Jordan. No IRCs Please.

KC6, PALAU. Mine, JA2NQG, announced another operation from Palau. He will again be accompanied by JH2BNL and JI2UAY. Mine and his friends will operate all bands and modes from September 8th thru 12th. Look for the callsigns: KC6AZ, KC6CW and KC6DX. Mine says he is now accepting written requests for schedule making for contacts on 160 and 6 meters! Write to: Mine Sugiyama, P.O. Box 5, Ninomiya, 259-01, Japan. Also see V63.

SV5, DODECANESE. As reported last week, Mike, SH0HV/9, will most likely start operating from SV5 on July 2nd for a 3-7 day operation. If he does not make the July 2nd start, he will try for July 13th. He will be on 80-10 meters phone only including the 12 and 17 meters WARC bands. In another DX effort, he will attempt to operate from Ierapetra which is to be the southernmost town in Europe. He will apply for a J49 callsign for that operation. QSL to KA5EJX.

TZ, MALI. TZ6VV has been active this week on 20 meter SSB and CW around 0000Z to as late as 0800Z. Listen for TZ6VV between 14200 to 14232 KHz on SSB and 14003 KHz for CW. QSL via N0BLD. TZ6DH was also active but on 21280 KHz around 2200Z.

V63, YAP ISLAND. On their way back from Palau Island, Mine and one of his friends will activate Yap Island (OC-12) as V63AR & V63AX September 13-14, 1991.

VP8, SOUTH SANDWICH ISLAND. The group that was forced to cancel their DXpedition to South Sandwich last year will be trying to do it again this December. They located a different vessel for travel that will cost less than the previous chosen ship. The eight team operators will land on Thule Island December 6 and operate for two weeks. Operations will be on all modes and all bands, which include the WARC bands. Callsigns and frequenices will be announced later in attempt to discourage pirate operations. CW and RTTY QSL's will be handled by KA6V and SSB QSL's will go to AA6BB. (More on QSLing at a later date.) This group is still seeking contributions. Send contributions to Jerry Branson, AA6BB, 93787 Dorsey Lane Junction City, Oregon 97448.

XU, KAMPUCHEA. XU8DX was active again this week. Activity was on CW between 14005 to 14010 KHz long path around 1100Z.

XX, MACAO. Look for XX9AF on the 14165 KHz W2MIG Net often at 1100Z with his QSL Manager K8CW (N.O.D.X.A. member).

XZ, BURMA (MYANMAR). Romeo, 3W3RR, was stateside this past week. Documentation for licensing for Romeo's upcoming XZ DXpedition was reviewed by the ARRL DXCC Desk. With the help of Ed, NT2X, who delivered the documentation, Romeo was informed that his license appears to be valid and is acceptable for DXCC.

YA, AFGHANISTAN. IT9AZS, IT9PHY, IT9GSF and I2RLX will be active from Afghanistan, July 12 to 29. Possible callsigns will be YA0AS or T6AS. Check for them on the following SSB frequencies: 3780, 7080, 14180, 18142, 21280, 24292 and 28580. On CW, look for them 1 KHz up from the bottom of the band edge. QSLs will be handled by IT9AZS.

DXCC/DXAC INFO. Although there has not been an official word or ARRL Bulletin, word has it the DX Advisory Committee has voted 16-0 to recommend that North Korea be added to the DXCC Countries List. Now it is up to the ARRL Awards Committee to accept the recommendation. The DXCC Desk is shooting for the October issue of QST for the annual Honor Roll Listing. The operation by 7X5ST who signed /3V8 still has not sent documenation to the DXCC Desk. The cards Don Search has seen are homemade and have very poor printing. Don said he is very skeptical of them and will not accept 7X5ST/3V8 cards at this time. The DXCC Backlog as of June 15, 1991: processing endorsements received 03/21/91.

868. 2 Mtrs up, 10 Mtrs down

Date: 1991-07-02 17:44:07 UTC
From: price@marlin.nosc.mil
Message-ID: <9107021744.AA25207@marlin.nosc.mil>
Source record: 295443

My interest in satellites got recently rekindled. When RS-10/11 first went up, I used the 15 mtrs up/10 mtrs down mode for a year or so and was making pretty fair progress toward WAS. Then the 15 mtr uplink was turned off, we moved, I lost track of the satellite passes, etc.

Now I understand there's an RS-12/13. Also AO-13 is usable daily, and AO-10 may come back someday.

So, I'm thinking about buying a 2 meter all mode radio, specifically the Kenwood TR-751 which, apparently, is going out of production. The question is: with 2 mtrs up, 10 mtrs down, which satellites can I use? Would I be better off to bite the bullet and buy a multi-band (2 mtr + 70 cm) radio? (I just *hate* to spend that kind of $ on VHF/UHF gear!) Does OSCAR have a 2 up/ 10 down mode ever? Any other suggestions for satellite-capable radios?

Thanks--Jim, K6ZH

>Do any of you CW wizards have some advice for a 15 wpm hacker on how
>to achieve high-speed and enjoy it?

Hi Gary ... high-speed CW is indeed enjoyable, especially with full QSK.
I have three tips for improving your CW speed:

1) Copy behind
2) Copy behind
3) Copy behind

Don't write or type anything until you've heard a few more characters go
by. It takes practice, and I'm still practicing it myself at 35-wpm.
I don't know what it is about the internal head-buffer that helps, but it
certainly keeps you listening, and improves the loop somehow.

Nearly all of my CW ragchews are done without writing down anything but
the essentials, or maybe notes for the next exchange, if we're not QSK.
But, after all, the point is to get the text to paper, especially if
you want to upgrade your license soon.

Personally I credit my CW speed to handling message traffic on CW.

Good luck!

Greetings,

Sorry to change the subject but it is along the same lines.
Does anybody know where I can get a chassis mount BNC connector WITH
A DOUBLE D cut on the threads? This is for an ICOM H2 radio.
Everybody sells it with only a single D cut. Thanks.

If you don't need to get the "5v" line coming out on the ring for something, use a standard two conductor 3/32 plug. The mike only uses the tip and shell (hot and ground respectively). Don't worry, the ring connection is designed to be shorted to ground so that the old Icom speaker mikes would still work. That "signal" on the ring might be to light the led on the speaker mikes that have one (like the 46's) or it might be to power the vox circuit in the headphones - I can't remember which is on which ring (I know one is on the ring of the mike jack and the other is on the ring of the speaker jack). Whichever it is, it is definitely designed to be shorted to ground.

/s/ Bob Gettys N1BRM

p.s. I've hooked many things up to ICOM walkies with no ill effects using the two conductor plugs.

I've used the 2-pin jacks (from Radio Shack) for mike connectors. You don't get the 5-volt supply for driving a condenser mike, but it's really easy to wire up a 3-wire condensor mike as a 2-wire mike (connect to high and low sides of the mike and connect the output thru a resistor to ground). BTW: You do 'short out' the 5-volt supply, but it's current limited to some appropriately low value so you don't have to worry.

I think this is the right idea. Most slower speed QSOs start out with
the A de B TKS FER CALL UR RST xxx QTH is xxxx NAME is xx SO HW CPY? BK
TO U format, with some information possibly repeated. Since you know
the basic idea, start out by only writing down the xxx parts and try
copying the other words strictly in your head. The xxx parts are the
only data in that sequence. Everything else is context.

$200 for a Hallicrafters SX-111. The price seems rather high. I
suspect you are paying for "collector value" rather for functionality.
In any event make sure it is in good working order unless you already
have an established supply of spare parts, especially vacuum tubes.

Message-ID: <1991Jul3.002152.13883@cbfsb.att.com>
Source record: 295455

copied from packet:

From: "CARTY ELLIS (KA2Y)" <CELLIS@BROCKVMA>
Subject: ALINCO DR-110T MODS

To broadband the DR-110T, while holding the "F" and "VFO/M" keys down,
turn off the power and then turn it back on (still holding the keys).
The radio now has factory programming reset - you just lost your memories
but at least mine now transmits and receives from 130 Mhz to 169 Mhz.
Before you do this, remove the top cover - notice the long (2 inchish)
loop of yellow wire coming off the back of the front panel - clip it!
NOW - after resetting the microprocessor - press the "F" key, then
press the "Mhz" key (mine now says 370). press the "f" key again, then
press the "Mhz" key again - (mine now says 870!). Mine will scan from
870.000 to 889.995 Mhz. I selected a 15Khz step because the channel spacing
in this range is 30 Khz. Toggle the "F" and "Mhz" keys and you're back at
144 mhz. Enjoy.

Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

Perhaps the reason is the TW-440's leak the IF out the antenna connector.
With an HF antenna connected, it radiates pretty well. With a VHF/UHF
transverter and VHF/UHF antenna, the HF interference is effectively
blocked.

> radios in my truck.
> Send or post your opinions of the other dualbanders and of these units.
> I'm leaning towards the Yaesu since I use their commercial units. I'd
> also like to hear about handhelds.

I looked into dualbander HT's. After looking at all the dualbanders I ended up looking at the Yaesu FT-470 and the Alinco DJ560T. Many of the others like ICOM and Kenwood just got out of my price range. I ended up with the Yaesu and am completely happy with it. I need to keep the manual handy though since there are a lot of bells and whistles (I think it brews coffee but just haven't read about it in the manual yet :-). A fellow Ham purchased the Alinco and he is happy with it although as I compare the two radios, I am glad of the choice that I made.

It is also worth noting that I called about every 800 number in QST to get the best price. Oklahoma Radio won the bid.

Source record: 295384

Mark E. Bouver, N3JLP asks:-

>Regardless of the particular antenna, which manufacturer do you think
>makes the best antennas for mobile use ?

I have always used Antenna Specialists (AS); expensive, but their
products seem relatively robust, and you can buy replacement parts
if you need them. My AS mobile 2m 1/2-wave has been exposed to the elements
for six years, and apart from replacing the whip element (got hit by an
overhanging branch at about 95MPH and pulled clean out of the top of
the shock-spring... BOINNNNG!!!) i have had no problems at all.
If you are after an 'Industrial Strength' antenna, look to the commercial
mobile-radio business, not the made-for-amateurs products!

To anwer Colin Schmutter+s question (could not reach him via e-mail):

Feng Yun 1-2 (1b) has lost attitude-stabilization some months ago, the same thing happend to Feng Yun 1. Tumbling-rate decreases, but little hope that APT will ever be active again. APT-freq. was 137.80 MHZ, format was very similar to NOAA+s.

OKEAN (3): APT-freq. 137.40 MHz, 4 lines/sec (!), transmission is *NOT* continuous. "low-res"-vis-scanner (1.8km resolution), passive 8mm-microwave-scanner, active radar-imaging, pictures sometimes combine 2 or 3 sources. I suppose that APT is mainly used to monitor ice-coverage of the northern USSR on demand of the ground-stations. I am interested to hear about OKEAN-APT-activity outside europe, any info is appreciated. Peter

>radios?
>

I'm very interested in satellite work as well. I thoroughly enjoy packet on 2m, but have always wanted to pursue satellite. All I have is a PC, TNC, and a 2m/70cm HT. What else do I need? I see ads for OSCAR up/downlink antennas, I hear about Kansas City Trackers, know that satellites have various up/downlink bands, etc. Could I get away with nothing more than an amplifier for the HT and some kind of antenna, or do I need the fancy tracking programs, radios, and such? Any and ALL help will be greatly appreciated!!!

>Randy, WA4FJF

My R5 has been very good to me. You might want to take a look at the new R7 instead though. The folks at AES tell me that they are shipping. The price is pretty high, but still under $400. That's no doubt quite a bit more than R5s are selling for now, so you'd have to decide if two more bands (40 and 30) are worth the extra cash. I was told by AES that no upgrade kit for the R5 is (or will be) available. Sigh.......

I called Ramsey about this problem and they told me to spread the 0.04 uH
inductors (L26 and L27) to tune the front end. But spreading them reduces the
inductance; you mentioned you needed more inductance...

How MUCH MORE inductance did you need? What value did you order from Digikey?
Was it the TOKO America MC120 series? MC122 series? 0.065 uH? 0.0994 uH?
0.141 uH? What Q inductor did you choose for the input tank circuit?

Can you provide the part number you ordered from Digikey? Thanks in advance
for your help!

Does anyone know of any mods for the Alinco DJ-560 dual band
hand-held? I saw the out-of-band transmit mod, but am more interested
in opening up the receive range, particularly down into the aircraft
band. The display does have an "AM" indicator, so maybe there is
hope. Of course, it would also be nice to receive in the 800MHz range
too.

903. Minneapolis hamfest/old tube xmtr

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-03 16:51:39 UTC
From: heacock@kuhub.cc.ukans.edu
Message-ID: <1991Jul3.115140.31865@kuhub.cc.ukans.edu>
Source record: 295474

Two topics:

(1) There's supposed to be a hamfest in or around Minneapolis/St. Paul next week (July 12-13?)--does anyone out there know anything about it?

(2) Just in case anyone is amused by this sort of thing: Last weekend the father of a friend of mine gave me a tube-type CW transmitter that he had built sometime in the '60's. We plugged in the power supply to see if it still worked, and although the light came on, in a few seconds one of the paper capacitors began sizzling and dripping (not too surprising, I suppose, since the rig has been in the closet for over twenty years). The transmitter itself is a two-tube unit, crystal-controlled, built for 40 and 80 meters. I don't recall the oscillator tube type, but the power amp tube is a 6L6. The power supply is in a separate chassis, and the transmitter itself is built into a rack-mount chassis that came out of some kind of military aircraft. We didn't find the crystals when we dug the thing out, but he's going to send them when they turn up. (He also showed me a pair of Globe Champions he had stored in a shed. These are *big* units. Anybody out there ever see/use one?)

Some may remember my earlier post about my father's lament that integrated circuits have "taken all the fun out of ham radio," etc...He's gonna *love* this old tube rig...:-)

If I actually get on the air with this thing, I'll let you know how it goes...

>lilt the plane of max radiation - some goes up and some goes down onto the
>road. I've found that 1/4 wave, being stiffer, gives almost the same performance
>as a 5/8 with the advantages of a compact design.

I once made a trial with a good-quality coaxial relay to switch between a fender-mounted 5/8 and a 1/4 mag-mount on the center of the roof.

At 60 mph or more the 1/4 (a very stiff one) seemed to outperform the 5/8. At the fringe areas you could hit a repeater with the 5/8 when it was impossible with the mag-mount 1/4 wave but only if you carefully searched for a good place and stopped the car.

Then I came across an article describing a "windom halo", i.e. a halo with a 1/2 lambda single wire feedline. It suits the original 5/8 mount on the fender and since the single wire feedline radiates vertically a bit, it is only about 6 dB below the 1/4 wave when working repeaters. But on horizontal polarization IT IS THE KING.

To substitute the negligible loss when working repeaters I just installed a small 80 W brick with a preamp. I can work our repeater all the way from my countryside 2nd QTH to work. That is all I need with repeaters. But operating FM, SSB and CW simplex is Real Fun. Last week I worked to Denmark via aurora (CW, at a parking lot waiting for my YL). It is more than 600 miles away (I once read in a handbook that VHF mobile is only good for 50 miles or so - with a repeater).

I'm kinda curious what he receives on a 92 Khz SCA. Most of the SCAs
I'm familiar with operate at 67 Khz. Some of them carry Muzak (tm),
the Physician's Radio Network, and, in some cities, a reading service
for the blind. Here in L.A., we used to have an SCA that would translate
selected prime-time network programs (real-time translation) into Russian.
(For you trivia buffs, it was on KROQ's SCA.)

It's difficult to find an "assembled" radio that receives it.
I built one many years ago using (I may be wrong on the part no.) a
LM 120. You might try to find a data book on it.

912. Re: How does FM-SCA work??

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-03 21:27:11 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1991Jul3.212711.12361@cbfsb.att.com>
Source record: 295382

I've seen (and picked up) a few manufactured SCA receivers at hamfests.
I've also tried building into regular radios SCA decoders, using CA3086
FM demod chips. Usual problem I always got was crosstalk leaking into
the demodulated SCA program from the main audio carrier. This was more
of a problem with the stuff I built, so I figure the manufacturers know
a lot better proper filter design, etc. (I'm sure no expert!)
But these manufactured receivers also suffered some crosstalk. Maybe
the antenna is important? Maybe the SCA decoder doesn't like multipath
reception? Anyone know?

>Everybody sells it with only a single D cut. Thanks.

Call ICOM parts: 206-454-7619. I had to order a new BNC connector, among other things, for an IC-2GAT when it fell off a tower :-(

Icom parts department is really good, and really fast. Better than Kenwood and Yeasu from what I've seen.

914. MD/DC QSO Party Rules & Sample Log (LONG)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-04 01:07:44 UTC
From: eab@voa3.VOA.GOV
Message-ID: <1991Jul4.010744.18385@voa3.VOA.GOV>
Source record: 295387

NEWS RELEASE

For immediate distribution

The Antietam Radio Association of Hagerstown, Maryland, W3CWC, will present the 1991 Maryland-DC QSO Party this summer. The contest will run from 1600 UTC August 17 to 0400 UTC August 18 _AND_ from 1600 UTC to 2359 UTC August 18.

[In other words, the contest will run from 1600 UTC August 17 to 2359 UTC August 18 with a 12 hour break from 0400 UTC to 1600 UTC August 18.]

MODES : PHONE AND CW/RTTY/DIGITAL

* Stations may be worked _ONCE_ per band using each mode.
* CW contacts may only be claimed if the QSOs was in the CW portion of the band.
* Non-Maryland/DC stations may only claim Maryland/DC contacts for scoring.
* Maryland/DC stations may work any other amateur station.

Portable and mobile stations that change Maryland counties [or states] during the contest count as a separate station in each new county [or state] of operation. Contacts through a repeater do _NOT_ count for scoring purposes. [Repeaters may be used to set up skeds with other stations, however.] All other HF/VHF/UHF contacts do count.

EXCHANGE: Signal Report, QTH _AND_ the MAJOR CATEGORY OF ENTRY.

* Signal reports should be in the standard "RST" format.
* QTH for Maryland/DC stations is either the Maryland county, "DC" for Washington, DC or "Baltimore City" for Baltimore City.
* QTH for non-Maryland/DC stations is either the US state or country of operation, if DX.
* Major Categories are: CLUB, QRP, MOBILE, NOVICE, TECHNICIAN, YL (XYL) AND STANDARD (for all others).
* Use only the one major category for your station.

SUGGESTED
FREQUENCIES:
* SSB: 1.860, 3.920, 7.265, 14.280, 21.370, 50.150 and 144.550 MHz.
* CW: 3.643, 7.060, 14.040, 21.115, 28.060 MHz. Suggested CW listening times are on the odd half-hour, i.e., 1730, 1930, 2130, etc.

SCORING: QSO POINTS
---

* Each simplex phone QSO counts as one point.
* Each simplex CW QSO (including RTTY/digital) counts as two points.
* For Maryland/DC stations, each QSO with a mobile station counts as five points.
* Each QSO with a club station counts as 10 points.

N.B. The highest point value applies, e.g., a CW/mobile contact counts as five points or a CW/club contact counts as 10 points.

MULTIPLIERS
---
* Multipliers may only be counted once; _NOT_ once for each band.
* For non-Maryland/DC stations, each Maryland county, Baltimore City and Washington, DC are multipliers. -- N.B. maximum 25.
* For Maryland/DC stations, multipliers are: Maryland counties, Baltimore City, the District of Columbia, each of the 49 other US states and one for DX -- N.B. maximum 75.

BONUS POINTS
---
* Mobile stations may ADD 100 bonus points to their raw score for each Maryland county/Baltimore City/DC they work outside their home locations from which 20 contacts were made.

FINAL SCORE:
* QSO Points X Multipliers + Bonus Points = Claimed Score

AWARDS:
* High score verified for each US state, Canada or DX;
* Top three Maryland logs;
* High scoring Maryland/DC club;
* High scoring Maryland YL (XYL);
* High scoring Novice;
* High scoring Technician.

CERTIFICATES:
* For each station with at least 100 QSO points;
* To the best SWL log (N.B. Must not be a licensed amateur radio operator.);
* For the highest scoring QRP station.

The decision of the judges is final.

The committee reserves the right to issue additional awards and/or certificates if deemed appropriate by the Antietam Radio Association.

Logs should be postmarked no later than September 10, 1991 and mailed to:

Antietam Radio Association
P. O. Box 52
Hagerstown, MD 21740

USA

Attn: MD/DC QSO Party Contest Committee (Log Enclosed)

Logs postmarked later than September 10, 1991 will _NOT_ be processed.

Be sure your log indicates your complete exchange information and your major category of entry, i.e., CLUB, NOVICE, MOBILE, QRP, TECHNICIAN, YL or STANDARD.

Any questions may be directed to:

WA3EOP
Contest Chairman MD/DC QSO Party
W. Page Pyne
109 South Artizan Street
Williamsport
Maryland 21795
USA

If you would like a complete listing of the results of the contest, send an SASE to the MD/DC QSO Party Contest Committee at the Antietam Radio Association address above.

I am selling an excellent Yaesu FRG-9600 receiver for VHF/UHF
(60-905 mHz). It has the optional video card installed (so it will
DX television signals if connected to a monitor) as well as the
optional Yaesu FIF-232C "CAT" computer interface. First $385.

PACKET INFORMATION NEEDED.

Does anyone have the details on AX.25 protocol in a file? If so,
could you please send it to 'edw@wells.UUCP'.

I am in the process of writing some software for the PK-232 (actually,
any TNC) in HOST MODE (RawHDLC ON possibly).

917. NiCd Cell rejuvenation - war stories?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-04 09:21:41 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <04.Jul.91.10
Source record: 295392

SUBJECT: NiCd Cell rejuvenation - war stories?

> 1) How do you go about injecting a metal-cased battery
>without snapping the needle off?
>
> 2) Where, in these drug-maddened days, can you lay hands
>on such a highly illegal and restricted piece of hardware as a
>functioning, metal-tipped hypodermic syringe?
>
> Actually, I can see it now: "Hi, I need to buy a hypodermic
>syringe and several nice big steel needles for it. And oh yeah, how
>about a gram balance while you're at it, to weight the batteries and
>find out which ones are light and need water? Er, hello? Hello...?"
>
In my case, i was using cells of the type that have a small rubber vent
plug next to the positive terminal (note this is often obscured by an
insulating cap). The needle goes through the rubber no problem, and it
seals up as soon as you pull the needle out.
My local practitioner of veterinary medicine supplied the syringe -
he also let me use the digital balance in his pharmacy to weigh the cells,
in exchange for me fixing a persistent software problem on the practice PC.

>Be prepared. Maybe you can order one for everyone of the Net...

Jameco does seem to be abandoning the small-parts customer with its $50 minimum, but Digi-Key still accepts tiny orders. They just tack on a $5.00 handling charge for orders under $25.00. It's not fun paying the $5, but often the total (with the $5 added) is stll less than what I would pay locally -- assuming I could find the parts locally. Not really such a bad deal.

919. HAMs and WAR in Slovenia

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-04 15:07:00 UTC
From: yu3fk@ijs.ac.mail.YU
Message-ID: <9107041508.AA08967@ixgate.gmd.de>
Source record: 295394

Hello friends !

I still do not beleive what happened here, it is so awfull.
Anyhow, it is maybe of interest to see how HAMs responded to
emergency.

When unexpected attack of YU Army to Slovenija happened, the first HAMs
reaction was: be QRV, stay tuned. There was no need to help with
proffesional communications, all worked OK. We only blocked
military repeaters and simplex channells on 2m band;
forunately most of MODS to
expand RX/TX range of japanese RIGs were available on BBSes.

Later on we were requested not to make QRM on military QRGs, because
we blocked channells so effectively, that YU3 intelligence could
not get any information from military communications. there is not yet
enough 6m equipment here, to effectively block military there, but
we were of some help to YU3 police. (YU got 50 MHz band few weeks ago).

Most of HAM communications(beside those helping actively defense operations)
are on helping press (some telephone lines are broken) and red cross. A lot
of personal request were handled by HAMs also (like: My parents are there and
there, we can not get them by telephone, are they OK ?).

YU3 HAMs can be found on 2m and 70cm FM, also there is a net on 3.605 SSB.

Packet:
As my role was in packet, I can tell the story from first hand.
First action was to check network. Everthing worked, so I send few bulletins
with emergency instructions to BBSes. Packet stations on R TV stations was
activated, with printer connected to C-64. I got few tlf numbers, like
red-cross, direct line to news service etc. Quickly, first news reports
were comming from area telephone cut. Also, i helped forward a QTC to
DL radio, when international telephone lines were overloaded.

When army started bombing of TV and communication centers, where most of
packet nodes were, we prepared secondary links. Few HAMs left packet stations
QRV, to be used as digipeaters. Several nodes were attacked:
4N3B on mt Boc, 4N3P on mt Pohorje, several times 4N3H on mt Kum,
and 4N3L on mt Krvavec. 4n3H antennas were destroyed, thus 23cm backbone
network was cut into two pieces. But, 2m links were ready - and YU3 packet
network is fully operative. No harm was done to 2m and 70cm FM
repeaters, so 4n3H is the only HAM installation destroyed.

We get also some help from outside YU3 - First of all, I asked everybody
to stop BBS forward and other DXing over YU3 - network is now free for
emergency traffic. Also, neighbour HAMs are ready to help us with

secondary links on 2m, if our current nodes are destroyed. We have a backup ready for any node. Also, they are in touch with red cross and others, if there is any need.

So far, HAMs were again playing our role in defence of our country. I hope is needed no more, but we are ready.

Packet node 4N3H is probably first HAM packet node to be destroyed in military attack. It had 4 antennas on 23cm to 38400 bd YT3MV 23cm station (4N3H-12), 2m port on 144.600 (4n3h), converse node 4N3H-3 and we were fixing also 70cm wide bandwith 19200 bd manchester user access node on 70cm.

So much about HAMs in war, I hope we would be able to make full report when war is over.

Best 73, peace to everybody, iztok YU3FK

921. Motorola to BNC

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-04 21:07:09 UTC
From: alyosha@drycas.club.cc.cmu.edu
Message-ID: <1991Jul4.160709.260@drycas.club.cc.cmu.edu>
Source record: 295398

Howdy folks...

Quick question:

I've got a dual-band mag-mount which I've had for years fo the end
of the antenna. Now here's the thing: I recently bought a Motorola
MT1000 for use on 440. As you may know, the antenna Motorola uses
there ever rigged someone up that would allow you to connect an
antenna that had a BNC connector on it to a Motorola radio? See
what I'm getting at? Presumably it would be something that
screwed into the Motorola, but had a male BNC connected to the
screwed-in thing.

If anyone has ever seen this done or has any idea how I could do
it, please let me know.
Thanks.

73 - Alex, KA2ZOO ALYOSHA@DRYCAS.CLUB.CC.CMU.EDU OR @DRYCAS.BITNET

its portables screw in. So what I'm wondering is, has anyone out there

In an emergency anyone can use any frequency to assist with the emergency,
at least that's the case here. Whether the DOTC might ask you later about
the capability of your rig is an unknown.

>> antennas for mobile use ?
>
>Decibel Products, Dallas,TX.

I agree, but I can't afford them. Larsen makes all around decent antennas. Prices are reasonable, performance is good. Antenna Specialists are also good. For dual-banders, the Diamond SG series is probably tops. I also use an Austin dual-bander, which is OK, but performance is basically equal to a 1/4 wave, which isn't suprising, considering it's 18" long, despite the manufacturer's claim that it's "known to outperform larger antennas". I have had bad luck with Pro-AM (made by Avanti?) and Cushcraft mobiles and have heard from a number of people that the Comet antennas, although similar in appearance to Diamond, are not as good as the Diamond equivilents.

>in opening up the receive range, particularly down into the aircraft
>band. The display does have an "AM" indicator, so maybe there is
>hope. Of course, it would also be nice to receive in the 800MHz range
>too.

I have a DJ-160 and I performed the out-of-band mod (clipping the loop of wire, then reseting the unit). I found that after the mod if you go into VFO mode, and press the "B" key, it will toggel between regular mode, air mode, and 800MHz mode. When in the 800 MHz mode the unlock dot is lit, meaning that it can't tune that high. When in the air mode it receives nothing because it doesn't have an AM detector.
I don't know if your DJ-560 will do this, I would think that it could. And it may be able to tune 800 MHz since it has a 440 MHz VFO. It may even be able to do air receive.
Let me know what you find out if you try this, I have a friend of mine that has a DJ-560 but hasn't tried this yet.

Source record: 295406

The satellite RS-12 is now with the mode K (21.210 MHz to 21.250 MHz up and 28.410 MHz to 28.450 MHz down) transponder on. The signals are very strong (Beacon 28.408 MHz) but I wasn't able to copy a CQ via the sat. It should be possible a contact with South U.S. because we are in the footprint for some short time. I would like to know if there is someone there using the RS-12 and what are the usual call frequencies (down link). I would like also to have the informations to decode the telemetry.

>Hi,
>
> I think that I recall hearing/reading somewhere that it is possible
>to modify this transceiver to be able to transmit on frequencies outside
>the ham bands. ....

Yes. It is possible and very easy to modify the FT-757GX as general coverage transmitter. There is a slide switch on one of the printed circuit boards which is in off position when you buy your radio. If you turn the switch in the other position your radio transmits where ever you want.

I don't have manuals here now, but I think the PC-board is named as Display Board or something like that. It is the one what is located just behind the rig's face. There is very much stuff in front of the switch but you can slide it for example with a small screwdriver.

>screwed-in thing.

Well, the Motorola portables have a 75-ohm antenna connection, so you need an impedance matching device as well. Fortunately, Motorola makes such a device, it plugs into (no need to screw it in) the antenna connector, has a little spring to connect to the ground side of the portable, contains a couple of parts to convert the impedance, and has a BNC. They come in different frequency ranges, so make sure you get the right one.

Good show. "Real radios glow in the dark" and all that. I've got a Heathkit DX-20, a Knightkit T-60, and a Harvey Wells TBS-50 (Bandmaster) transmitter, all on the air. I use the DX-20 with a Drake 2-B all the time, and am well on my way to WAS with the vintage rig. I have so much fun crystal controlled on 40 meter CW that I hardly ever fire up my Yaesu sideband rig anymore. Keep the faith; nostalgia just isn't what it used to be...

I'm very interested in satellite work as well. I thoroughly enjoy packet on 2m, but have always wanted to pursue satellite. All I have is a PC, TNC, and a 2m/70cm HT. What else do I need? I see ads for OSCAR up/downlink antennas, I hear about Kansas City Trackers, know that satellites have various up/downlink bands, etc. Could I get away with nothing more than an amplifier for the HT and some kind of antenna, or do I need the fancy tracking programs, radios, and such? Any and ALL help will be greatly appreciated!!!

That should be enought to work some of the pacsats. To work voice you need to be able to do sideband instead of FM. And for these satellite you usually need some steerable high gain antennas.

BTW, I am selling my Yaesu 726 all mode multi-band radio. Great for satellite work. Inquire for details.

By far the most effective way to increase your code speed is to get on the air and QSO on CW, even better in a contest.

If you can't do that, the NEXT best way would be to by the AEA MM3 keyer. The MM3 has two wild modes that are fantastic for learning and mastering CW, in addition to the standard code tape emulation modes.

The first is the QSO simulator. Put the keyer in that mode and CQ de your callsign on the paddle, or let the keyer sit there a while and IT will call CQ. You will "work" stations with random call signs, names, and QTHs and they will call you by the name you send and acknowledge your QTH, tell you about their rig and WX, etc. Pretty slick.

The other mode is the contest simulator, along the lines of Doctor DX if you are familiar with that. Changes bands and you will hear callsigns appropriate for your area for that time of day. Call CQ and you might get to run stations or someone else may start calling CQ. You can set the range of code speeds that stations will use, and many other parameters. The callsigns are realistic and random.

It is also a FB keyer, as well. 73 John Pescatore WB2EKK

933. Police Radar

After seeing the discussion on police radar pop up again, I just couldn't help throwing in a plug for an organization seeks to protect the interests of motorists:

National Motorists Association
6678 Pertzborn Rd.
Dane, WI 53529
(608) 849-6000

I know at least one other ham is a member, because a picture of his Trans Am appeared in both the NMA newsletter and 73 Magazine some time back.

(I have no other connection with NMA other than as a dues-paying member. In other words, I get no commission for referring new members. So there.)

73,
Jeff Miller NH6ZW AFA8JM

>to you propose to tell who is and who isn't a "coded" ham? Since there
>will be no difference in the FCC files between an old Tech (pre 2/91),
>no-code Tech and a Tech plus? What if they aren't in the callbook yet?
>In 4 land Novices, Techs and Generals are all issued KD4xxx calls!!!

Ah, yes...the more things change, the more they stay the same...seems like
this was the status quo prior to 1978, when the new calls came out, except
that it was *W*D4...same thing happened in 6-land, too. Only difference
now is that Adv/Extras are getting "better" calls, but even now they're
both getting 2x2's....

My colleague from over Kolekole pass, KH6R, writes...

> As in the past few years, the Honolulu Amateur Radio Club (KH6WO) operated
>field day '91 from Kualoa Beach Park on the windward side of Oahu. The setting
>up, operating, eating, eyeball qso's etc. were all as before but a new twist
>was added this year. At about 10 pm NH6KW whipped out his ukulele and some
>song sheets and conducted a sing-along till almost 1 am. Needless to say, all
>had a GREAT time.....especially the XYL's and other non-operators.
> Guess he created a new tradition for KH6WO field day....Next year when you
>work us, Listen up....you might hear 'Lahainaluna' or 'Tiny Bubbles'!!!!

So *that's* what that sound rolling across Waimanalo Ridge was....

Just down the road at KH6CTQ (Bellows Field, Waimanalo), our field day
was just a little bit less musical...well, OK, cw is music to some people's
ears...

We made about 300 QSO's, mostly on 20 and 15 phone, with a smattering of
40 phone and 20/15 cw. Also made a few 20m packet QSO's...tried satellite,
but operator inexperience combined with pass time uncertainty proved too
much to overcome :-).

As others noted, 17, 12, and 10m were pretty much a wash...

Well, at least we got on the Sunday night local TV news...oh yeah, the
bodyboarding on the Windward side isn't too bad this time of year, either :-)

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
July 05 to July 14, 1991

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0

Based In-Part from Data Supplied By
The Space Environment Services Center

SOLAR TERRESTRIAL REVIEW FOR 28 JUNE TO 04 JULY

Solar activity this week was generally moderate to high. The most significant solar flare of the week originated behind the east limb from returning old Region 6659 (now numbered as Region 6703). The event was a very long duration class M6.0 x-ray event. Its poor position behind the eastern limb prevented any optical correlation with the x-ray burst. The x-ray event endured for a period of 334 minutes, reaching its maximum at 06:26 UT on 28 June. The only optical correlation was a loop-prominence located at 30 degrees north latitude on the eastern limb. Significant calcium emissions preceded the appearance of this region. This major solar flare is believed responsible for producing the satellite proton and polar cap absorption events at 07:55 UT on 30 June and 17:15 UT on 01 July respectively. The proton event reached a peak of 110 pfu at 10:10 UT on 02 July (at greater than 10 MeV) and ended on 04 July at 20:15 UT.

The geomagnetic field was generally unsettled to active throughout the week. The most active day of the period was 03 July, when minor storming was observed over the higher latitudes. This activity was confined mostly to the higher latitudes although a few brief periods of minor storming were observed over the middle latitudes. Since 03 July, activity has been mostly unsettled, becoming quiet.

Auroral activity was relatively dormant. The most active day of the period was 03 July. Northerly middle latitudes experienced periods of moderate auroral activity. High latitudes witnessed moderate to high levels of activity on this date. Thereafter, activity diminished over the northerly middle latitudes and became generally low over the high latitudes (with a few periods of moderate activity).

HF propagation conditions were not particularly good this week. Polar regions experienced strong absorption levels and periods of complete blackout due to the proton activity and associated polar cap absorption event. High latitudes faired better, but still experienced periods of high absorption and isolated periods of near blackout conditions. Middle and low latitudes

suffered daytime shortwave fades (SWFs) associated with minor and major solar flaring, but retained relatively good propagation conditions during the evening hours after sunset.

VHF propagation conditions have been generally normal over most regions. No significant signal scatter opportunities were observed, except possibly over some higher latitude regions where some forward scatter may have occurred during the evening hours. Meteor scatter probabilities are elevated at this time (and will remain elevated throughout the month of July), although no reports of meteor scatter have been received.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to continue mostly moderate. There are several regions which may be capable of producing minor M-class flares. This includes Region 6703, 6713, 6711 and 6699 (for locations, see the data below). There is also a slight risk for another isolated major flare over the next week from one of these regions, although at the present time, the most likely candidate for future major flaring will be Region 6703. Region 6703 (old Region 6659) exhibited significant decay since it's last appearance as the potent Region 6659 in early June. It is now a relatively simple beta spot group of moderate size.

Geomagnetic activity is expected to remain generally quiet to unsettled. Recurrent coronal effects should increase geomagnetic activity slightly between 08 July and 12 July to mostly unsettled to active conditions. Provided no significant solar events occur, no significant storm periods are anticipated. This could change, however, should a major energetic solar event occur this week. The risk for such an event occurring is rather low at this time.

Auroral activity is expected to remain generally dormant. An increase is likely to be observed between 08 July and 12 July, although the activity is expected to remain confined to the high latitudes. Northerly middle latitudes should witness periods of low to moderate auroral activity on these dates. No significant auroral storming is expected, barring any major solar activity.

HF propagation conditions will remain generally good over the low and middle latitudes, with isolated and localized periods of fair conditions. Minor SWFs will continue to be observed during the local daytime hours with good conditions during the local evening hours after sunset maximizing over most regions. High latitude regions should maintain generally fair to poor propagation conditions. Provided further major flaring does not replenish proton densities in the near-Earth environment, polar regions should witness generally fair to poor propagation conditions with a gradual decline in absorption levels. Protons are still enhanced below event thresholds at this time and are continuing to decay toward background levels.

VHF propagation conditions will remain mostly normal this week, with a slightly better probability for DX during the month of July. Increased meteor scatter should provide some potential DX periods. Localized regions

of sporadic E are also likely to push local MUFs above the 6 meter band for brief periods over the low and middle latitudes. However, overall MUFs are expected to remain below 45 MHz.

CONFIDENCE LEVEL: 65%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "oler@hg.uleth.ca".

938. extended xmit mod for IC-4SAT needed

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-05 21:47:03 UTC
From: gettys@regent.enet.dec.com
Message-ID: <24110@shlump.lkg.dec.com>
Source record: 295415

I vaguely remember seeing a mod for the Icom IC-4SAT to extend its xmit range. I intend to use this to access the lower portion of the ham band that Icom left out! No flames about out of band xmit please! If someone could send them to me or post it, it would be much appreciated. An ftp site is a poor third to me as I must use a mail server to get ftp stuff and have had poor results with that route in the past.

Thanks much

73's Bob N1BRM

939. expanded tx coverage

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-05 22:23:36 UTC
From: lrk@k5qwb.lonestar.org
Message-ID: <2Pum51w164w@k5qwb.lonestar.org>
Source record: 295421

I can't beleive we missed this obvious reason for modifying ham rigs:

When unexpected attack of YU Army to Slovenija happened, the first HAMs
reaction was: be QRV, stay tuned. There was no need to help with
proffesional communications, all worked OK. We only blocked
military repeaters and simplex channells on 2m band;
forunately most of MODS to
expand RX/TX range of japanese RIGs were available on BBSes.

Best 73, peace to everybody, iztok YU3FK

Good luck, iztok, and keep us informed.

940. Major Solar Flare Alert - 05 July

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-05 22:36:36 UTC
From: oler@HG.ULeth.CA
Message-ID: <910705163636.21c00c32@HG.ULeth.CA>
Source record: 295414

-- MAJOR SOLAR FLARE ALERT --

JULY 05, 1991

Flare Event Summary
- No Significant Impact Expected -

MAJOR ENERGETIC EVENT SUMMARY

A major solar flare was observed from Region 6703 at a location of N25E28 on 05 July. The event began at 08:37 UT, peaked at 09:06 UT and ended at 09:31 UT. The flare was rated a class M5.4/2B event. This flare was not associated with any significant radio emissions or sweep frequency events.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

No terrestrial impacts are expected from this event. Likewise, no proton enhancements are expected as a result of this flare. If any impacts do materialize, they should be light.

Region 6703 was quite dormant prior to this last major event. There is a fairly good possibility for another major flare from this region within the next week. There is a slight possibility for an event energetic enough to enhance proton levels back above event thresholds. For this reason, the Potential Satellite Proton Warning and the Potential Polar Cap Absorption Event Warning will remain in effect until Region 6703 begins to exhibit more dormant activity levels. There is a slight risk for an isolated X-class flare from this region, although the risk is rather low (~ 10 - 20 %).

Region 6703 is now in a fairly good position for beginning to produce terrestrial impacts should particularly significant flaring develope. At the present time, the probabilities are not very high for significant solar flaring from this region, although the potential is still there.

The geomagnetic field is expected to remain generally unsettled over the next 48 to 72 hours, barring further major flaring or other significant solar events.

** End of Alert **

941. Field Day - Counting satellite QSOs

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-05 23:04:00 UTC
From: CSMSCST@MVS.OAC.UCLA.EDU
Message-ID: <9107052305.AA08149@ucsd.edu>
Source record: 295416

Our FD satellite guru just passed me the following info vis
a vis counting satellite QSOs, which he confirmed by phoning
the ARRL:

"Satellite" is one band. Therefore, you cannot count credit
for working the same call on both SSB and CW. You still get 2
points for CW and one point for SSB contacts, but you have
merge both logs together when culling out dupes. (Obviously,
one discards the SSB dupes since the CW contacts are worth twice
as much.)

Somehow I doubt very many people picked up on this subtle
point...

73, /Chris

942. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-06 01:35:48 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9107060135.AA04974@blackbird.afit.af.mil>
Source record: 295417

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

In some article during this extended discussion, someone wrote:
> In TN an accident occurred behind me on a busy street inside a tunnel.
> Similarly, upon contacting 911, I got the challenge "Well sir, you
> couldn't possibly be where you say you are because I have your name,
> address and phone number right in front of me." Identifying myself as a
> ham radio operator and explaining the equipment quickly seemed satisfactory
> to this person, but who knows.

We use a slightly different technique, which may or may not apply to your area depending upon the coordination level of your local law enforcement agencies.

In Southern California, there is a single coordinating agency for 911 calls that come from CELLULAR TELEPHONES! We obtained the 7-digit number that 911 translates to from a cellular phone, and installed it as the 911 speed dial number in the autopatch. Now, whenever anyone dials 911, at least the person answering the call is expecting a mobile "phone" - most of them are even starting to recognize the characteristics of an autopatch call.

Contact your local cellular telephone company and ask how "mobile 911" calls are handled. If they're sent to a central agency, this scheme may work for you. I suggest that you get the phone number from a friend of the agency rather than from the cellular phone company, however; they consider it to be a "non-published" number and have been known to go to great lengths to keep it secret.

MONDAY JULY 8, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* ERS-1 SATELLITE LAUNCH *
==========================
ERS-1 SATELLITE LAUNCH SCHEDULED FOR 16 JULY

The first European Remote Sensing Satellite, ERS-1, whose launch was
previously planned for 03-May-1991, is now scheduled to be launched
from Europe's spaceport at Kourou, French Guyana, during the night of
16 to 17 July 1991 at 0346 Paris time.

The launch had to be delayed to allow additional tests on, and a
modification to, the third-stage engine of the Ariane-4 launch vehicle.

The launch will put into orbit the biggest, heaviest and most complex
European satellite developed so far. During it's two to three year
mission, it will make a significant contribution to research into the
Earth's environment.

In addition to the ERS-1 payload, this mission will also launch the
latest Amateur Radio satellite, UoSAT-F.

[Info via Kaj Wiik, OH6EH/2]

* GALILEO NEWS *
================
NASA's Galileo spacecraft turned and fired its small on-board thrusters
last Tuesday setting its course for an encounter with the asteroid Gaspra
on 29-Oct-91. Galileo is expected to enter a Jupiter injection orbit in
December 1995 after sending a probe into Jupiter's atmosphere.

* SOVIET VHF EXPERIMENT *
========================

An International Plasma Plume Characterization Experiment is planned for some time in 1992. VHF radio operators will take part in this experiment in order to map the plume of a Cesium Hall rocket thruster by correlating the strength of a satellite signal at known locations on the ground. The plume of such a thruster is highly ionized, so it is opaque to radio waves below the plasma cut-off frequency. The specific frequency varies with the local free electron density. A reasonably dense plume has a cut-off frequency in the VHF range.

The spreading of the charged particles in the plume is affected by the Earth's magnetic field, so predictions are not simple. The shape can be found by examining a signal broadcast from the same satellite that is firing the thruster. The signal can be examined by ground stations. Each station must provide an accurate location and an accurate record of the times the carrier signal is lost or regained.

[Info via Greg Macrae @ NASA Lewis Research Center]

* SOLAR ECLIPSE INFO *
==========
On July 11, 1991 starting at approximately 18:00 UTC, a major solar eclipse will begin to engulf North America. During this event, several OSCAR satellites will be flying through the umbra or the darkest part of the eclipse. Radio amateurs have a unique opportunity to observe the eclipse by watching the telemetry from these satellites. In fact, AMSAT is asking all radio amateurs to make an attempt to collect telemetry as the satellites pass into and out of the eclipse. The focal point of the data collection will be Weber State University (WSU). A plan is being formulated to have all the telemetry collected sent to WSU for a "quick-look" analysis and to post the results as quickly as possible in the AMSAT News Service (ANS) according to Chris Williams (WA3PSD) of WSU. Jim White (WD0E) says that he will be particularly interested in examining solar array currents and temperatures as the MICROSATs pass through the transition zone, the penumbra, to darkest zone, the umbra.

946. Mods for Yaesu FT-411E

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-06 18:29:00 UTC
From: sehrlich@helios.northeastern.edu
Message-ID: <memo.1146881@lynx.northeastern.edu>
Source record: 295420

The subject says it all. I am now the owner of a Yaesu FT-411E, and would like to know if there any mods available for it (especially for out-of-band). I discovered the mod when, while the rig is turned off, holding down the up/down arrow keys, then turning the rig back on. Any other mods available (even internal mods i.e. clipping things here and here, throwing in jumpers, etc).

Thanks in advance for any info.

947. 2 Meter Rigs Compared - Questions

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-07 01:37:52 UTC
From: edg@netcom.COM
Message-ID: <1991Jul7.013752.13588@netcom.COM>
Source record: 295425

I'm considering a two meter mobile rig. I don't have enough dough for
a dual bander, or an all mode rig, or the like, but I would like to get
a new 2 meter jobbie with all the bells and whistles.

Under consideration at this time are the:

ICOM IC-229H -- Up to 50 Watts, 20 memories, 136-174 MHz
receive, etc.

YAESU FT-2400H -- Up to 50 Watts, 37 memories, Remembers names
of channels, mutes pending incoming DTMF, automatic repeater offsets,
etc.

Both units offer CTCSS encode as standard.

Both seem to come in under $400.00.

The Yaesu doesn't offer expanded receive capability, at least not in the
brochure.

Questions: Does anybody have either of these rigs. In the case of the
ICOM, there are other 229's that are the same except for lower power.

Do you have comments, yea or nay, on either of these rigs.

Do you know of an out-of-band receive mod for the Yaesu?

Any other rigs to be considered? What do YOU like?

Thanks,
-edg

948. Re: Antenna Manufacturers.. Mobile 2m/70cm: Comtelco

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-07 01:49:34 UTC
From: brian@nucleus.amd.com
Message-ID: <1991Jul7.014934.4996@dvorak.amd.com>
Source record: 295422

Tom Poindexter writes:
> I saw an ad for a cheapie 2m/70cm mag mount from an outfit in
> Chicago called Comtelco in 73 Magazine. Does anyone have any
> experience with this antenna? Good/bad/indifferent?

I've got one of their permanent 2m/70cm antennas mounted in the center
of the roof of my car. Here's a summary:

1) it fits in my garage
2) it is a very good 1/4 wave 2m antenna (it has the same gain as an
end fed 1/2 wave Larsen dual band mounted in the same place)
3) it fits under trees
4) it is a 70cm dummy load (it compares poorly to my HT's rubber duck)
5) it was cheap
6) despite its performance, it does function on 70cm (no SWR info...)
6) it unscrews and can be replaced by a real antenna when needed :-)
7) it fits in parking garages

I do not claim that my (careful, scientific, accurate to the 12th
decimal) measurements of this antenna represent the antenna (rather
than my coax or connectors).

Some side notes:

The antenna comes with a (cheap) press fit connector on the end of
the lead wire. If you plan to permanently mount the antenna, you
will probably have to remove and replace this, so ask them to leave
it off.

This is a 1/4 wave antenna at 2m. It really wants to be mounted in
the center of your roof with the coax braid solidly connected to
the metal of the roof. Magnetic mounts can't really do this.

> /usr/bin/postnews: $HOME/.signature rejected, poor taste

Cute...

950. review of Kenwood TM941A tribander 2/440/1.2

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-07 02:59:42 UTC
From: brian@ucsd.Edu
Message-ID: <36928@ucsd.Edu>
Source record: 295426

I've had a new 941 for about two weeks now, and I'm rather pleased with it so far. It is a tri-band box, with three independent modules for 144, 440, and 1.2 G, with a nice LCD display in a detachable control head.

Lots of memories and features - see the brochure for details. $1025 from Juns.

Transmitters were clean and did nearly rated power: 52 w on 2m, 31 w on 440, and 11 w on 1.2. Receiver sensitivity was .22 uv on 2, .25 on 440, and I can't measure it on 1.2 because my generator is on its second harmonic up there.

Major problem, however: ALL the synthesizers were off channel out of the box. 2m was 500 Hz low, which is far enough that I wanted to reset it, 440 was 1.8 kHz low, which is totally unacceptable, and 1.2 was 1 kHz low, which should have been better.

To set two of these isn't too hard; first (or last) you set the 2m freq by tweaking a trimmer through a hole in the top of the top module; all you have to do to get to that hole is take out four screws, loosen two others, and lift off the top housing.

To set the 440 reference osc, you remove a bunch more screws and a A+ bus strap, then unplug the top (2m) module, turn the radio on (display will show OFF where it used to show 2m stuff), and tweak the trimmer.

It is an A-prime-#1-sterling pain in the butt to set the 1.2 GHz synthesizer. You can easily remove the middle (440) module to get to the 1.2 ref osc, but when you do that, you've also removed the power feed to the radio, so what you have to do is tweak the trimmer just a bit, slide the 440 module back in place, check the freq, and repeat until you're happy or totally frustrated. I'm sure Kenwood tweaks the modules in some sort of test jig - wish I had one. Three other samples were also off channel - one worse than mine on 440. Dunno where Kenwood gets their crystals, but they ought to age them more than they do before they use them for synthesizer references!

Receive audio is good, but the microphone supplied is real short on low frequency response. I found a .033uf capacitor in series with the electret; by crushing that and replacing it with a .1 uf the bass response came up just a bit and the audio is much more pleasing, especially if you have a big speaker on the receiving end. (I use an old stereo bookshelf speaker system.) Without that mod, the microphone sounds too tinny. You MUST learn to talk ACROSS the microphone, not INTO it, or else you'll sound like someone in Cheyne-Stokes.

Out of band receive is ok, with the AM aircraft rx somewhat of a bizarre feature, but it works nicely. Sensitivity falls off by the time you

reach the coverage edges, but it's still 2uv at 174 MHz. I haven't installed the out-of-band transmit mod yet - laziness, primarily, although when you do it you lose the AM aircraft mode. There's also a cross-band repeater mod for extending the coverage of your walkie, repeating police onto the autopatch, etc.

Human interface is a bit bizarre, but short of putting a complete ASCII keyboard on the radio, it's not too bad. Only a few of the functions are not obvious, although it's sometimes hard to remember which ones you get to by holding the function key for 5 seconds and which you get to by merely touching it for less than a second. Bleah.

This radio runs HOT, even when it's not transmitting. There are two stereo 6w audio amp ICs near the front, and they dissipate a lot of heat. (Why FOUR audio channels? 2m, 440, 1.2 each can have their own speakers, plus there is a mixed output.) I'm very seriously considering adding a micro fan to the device to run some air past them. There is a separate fan on the back of the unit which blows air past the RF power amp heatsinks - that fan turns on when you key the unit, and runs for about a minute after your transmission ends. The heatsink fan doesn't cool the inside of the radio, though.

The control panel detaches and can be Velcro'd to your dashboard or sun visor (it's less than an inch thick). It communicates with the radio over a four-wire flat cable which carries ground, +V, and one serial line in each direction. I haven't yet figured out the protocol used on the serial cable, so I don't yet have a way to interface the radio to a computer, but the serial data contains ALL the control and display information, including S-meter, frequency display, etc. What happens is that a microprocessor in the body of the radio is communicating with a second uP in the control head. Kinda nifty. By the way, the uP in the radio is on all the time it's powered, even when the control head is switched off - you can see the radio polling the control head about once a second even when the control head is dark. The microphone plugs into the body of the radio separately, using a standard 8-pin modular phone RJ-45 plug. You can buy an extension cable and bracketry for way too much money if you want.

I haven't been able to worm a service manual out of anyone yet; HRO keeps telling me it'll be $30 if it ever shows up. No one I know has one.

Considering that a recent telephone survey of most of the mail order ham radio suppliers yields the information that there aren't any TM-541 single-band radios in stock anywhere in the USA, this may be the way to upgrade your 2m and 440 radios whilst expanding to 1.2G. That's why I saved up my pennies and bought one. Takes up less room too.

I'm told the 741 will be essentially the same radio with the 1.2 module omitted - you can buy your choice of one of 10m, 6m, 220, or 1.2 to go in the hole, according to preliminary reports. In the boondocks where 1.2 activity isn't hot (it is here in SoCal), that might make a nice

2/220/440 radio. Betcha it costs more.

- Brian

951. MAJOR SOLAR FLARE ALERT - HIGH IMPACT POSSIBLE

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-07 07:33:06 UTC
From: oler@HG.ULeth.CA
Message-ID: <910707013306.21c00e90@HG.ULeth.CA>
Source record: 295328

-- MAJOR SOLAR FLARE ALERT --

JULY 07, 1991

Flare Event Summary
** ALERT - HIGH IMPACT POSSIBLE **

MAJOR ENERGETIC EVENT SUMMARY

Region 6703 spawned a major class X1.9/2B tenflare with Type II and IV sweeps at a sensitive location of N26E03. The event began at 01:19 UT, peaked at 02:23 UT and ended at 02:48 UT on 07 July. The 10.7 cm emissions peaked at 690 sfu. The duration of the tenflare was a respectable 64 minutes. Although this event has been rated a 2B optical flare, there are concerns that it may actually have been a 3B event. Poor observing conditions at the observing sites prevented an accurate determination of the optical flare size. This flare could be corrected to a 3B event, although at the present time it will stand as an optical 2B flare.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

A moderate to high terrestrial impact is expected from this latest major energetic solar event. A minor to major geomagnetic storm is anticipated for 09 and 10 July. The interplanetary shock is presently expected to arrive late in the UT day of 08 July or early on 09 July. The ensuing geomagnetic storm could reach severe storm levels over the high latitude regions.

A major auroral storm is possible on the UT days of 09 and 10 July. The most intense period of storming is expected to occur on 09 July. A Low Latitude Auroral Activity Watch is being issued for the low latitude regions. Auroral activity may become intense enough to be viewed over the central middle to low latitude regions. Lunar phase will not be a major factor either, which should provide optimum viewing conditions under a dark sky. The risk for potential major auroral storming is fairly high.

A satellite proton event began at 04:55 UT on 07 July. A rather strong HF sudden enhancement was observed above 20 MHz over the night hemispheric regions with the arrival of these 10 MeV protons. 100 MeV protons have so far remained at background levels. Polar cap absorption is beginning to increase. A PCA event is likely to be observed over the next 12 hours.

An ionospheric storm is expected to be observed on 09 and 10 July. Significant degradation in HF signal quality and propagation is expected with this disturbance. All latitudes are expected to suffer the effects of this activity, although the middle and high latitudes should experience the worst

conditions. Periods of near complete HF blackout conditions may be observed over many middle and high latitude regions. Some improvements may be observed on 10 July although no real improvements are expected until 11 July. Daytime propagation conditions are expected to be the most stable. Night time propagation conditions should yield the most unstable HF conditions. Middle and high latitudes could suffer severe auroral flutter, fading and distortion on 09 and 10 July. Low latitudes should also suffer periods of strong fading and distortion, particularly on the UT day of 09 July.

There is a fairly high probability for middle and high latitude VHF auroral backscatter on the UT days of 09 and possibly 10 July. This will be dependent on the nature and strength of the interplanetary disturbance. The potential for possibly significant VHF scatter conditions exists for these dates (particularly the UT day of 09 July).

Region 6703 (which is old Region 6659) is a proven potent region. Almost every previous major X-class flare from this region has had a moderate to very high terrestrial impact. This flare is not expected to be an exception. It was well placed and had most of the characteristics necessary for producing moderate to high terrestrial impacts. We expect at least a minor geomagnetic storm, with a high risk for a major geomagnetic storm. Periods of severe storming will be possible over the high and northerly middle latitude regions on 09 July.

** End of Alert **

952. LOW LATITUDE AURORAL ACTIVITY WATCH

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-07 07:40:07 UTC
From: oler@HG.ULeth.CA
Message-ID: <910707014007.21c0041b@HG.ULeth.CA>
Source record: 295330

/\

LOW LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 07:00 UT, 07 JULY

/\

ATTENTION:

A major class X1.9/2B tenflare located at N26E03 from Region 6703 is expected to have a moderate to high terrestrial impact. A minor to major geomagnetic storm is expected from this event. Present evidence suggests the geomagnetic activity will likely be within the major event category.

A major auroral storm is expected to develope on the UT day of 09 July. If activity is sufficiently intense, lower latitudes could observe the activity. Preliminary analysis suggests this flare event could provide the necessary conditions to spawn a major auroral storm visible from the lower latitudes. Lunar interference will not be a major factor during this event, provided observations are made before 2 am local time and after evening twilight ends. For these reasons, there is a sufficiently high risk to warrant the issuance of this Watch.

There is a good possibility that the main phase of the geomagnetic and auroral storm (the most intense phase of the activity) could occur during the evening and early morning hours of 09/10 July. If this occurs, North American observers may have the best opportunities for viewing auroral activity.

By 10 July, activity should enter the post-storm phase where auroral activity is less likely to be observed over the lower latitudes, but may still be remotely possible over localized areas (particularly over the central and northern middle latitudes).

A formal auroral prediction will be issued later this UT day. This Watch may be upgraded to a Warning within the next 24 to 48 hours if evidence warrants.

** End of Watch **

953. POTENTIAL MAJOR GEOMAGNETIC STORM WARNING

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-07 07:46:10 UTC
From: oler@HG.ULeth.CA
Message-ID: <910707014610.21c00b97@HG.ULeth.CA>
Source record: 295329

/\

POTENTIAL GEOMAGNETIC STORM WARNING

07:00 UT, 07 JULY

/\

ATTENTION:

A major class X1.9/2B tenflare located at N26E03 from Region 6703 is expected to have a moderate to high terrestrial impact. A sudden storm commencement should be observed late in the UT day of 08 July or early in the UT day of 09 July.

Current data suggests the geomagnetic disturbance will likely reach the major storm category (A-index greater than 50). Middle latitude K-indices of 5 and 6 are expected with possible excursions of 7. High latitude K-indices between 5 and 7 are expected with possible excursions of 8.

The main phase of the activity is expected to be observed on the UT day of 09 July. The duration of the main phase should be between 12 and 18 hours. The post-storm phase should be observed sometime on 10 July with definite improvements and increased stability occurring on 11 July.

A Geomagnetic Storm Alert will be issued if activity surpasses event thresholds.

The following information is from the ARRL Regulatory Information
Branch files:

This report was compiled from data given to ARRL HQ from ARRL
State Government Liaison volunteers. If you know that any of this
information is incomplete, a letter to the Regulatory Information
Branch at ARRL HQ would be appreciated. Email sent to
2155052@mcimail.com Subject: "Attention RIB" will be printed
and forwarded to the Regulatory Information Branch.

NOTE: Most states require a copy of an FCC amateur license as well as
proof that tax has been paid on the vehicle. They also require
that the title is in the ham's name. The license fees, in most
cases, are in addition to the usual registration fee.

The asterisk indicates that the information is from 1986.
All other information is current as of 1991.

STATE INITIAL/RENEWAL FEE NOTES

Alabama* $ 3/3
Alaska* $ free/free General or above with 5 band
capability
$ 20/30 Novice or Technician
Arizona $ 5/free
Arkansas $ 2 private passenger vehicles and pickups
only - October 1 deadline
California $ 21/none
Colorado $ 2/2
Connecticut $12/Free Only issued for passenger, commercial,
combination, camper or motorcycles
Processing time-9 weeks
Delaware* $ 10/free
Florida $ 5.00/1.50
(service fee) 2.50
(postage fee) 1.30
Georgia* $25/25 same cost as vanity plates
Hawaii* $ 3.25/3.25
Idaho $ 5/free
Illinois $3/free Illinois residents over 65 can get
plates at half cost--excludes amateur
"Ham Radio" appears on plate
Car, truck or motorcycle only
If driver has ham tags, may legally
use a headset
special brochure available

Indiana $ 2/2
Iowa* $ 5/5
Kansas $ 1/1 Passenger or trucks
Same call sign/tag permitted on cars
and trucks
Kentucky* $ 25/25
Louisiana $ 1/1
Maine $ 15/15
Maryland* $ 5/5
Massachusetts $40/40 Ham tag fee is half way between
regular plate registration of $20 and
vanity plate fee of $70
processing time is 3-4 months
passenger vehicles only (law pending
to include other types of vehicles
Michigan $ 2/free Novice operators not eligible for ham
plates
Only people with ham tags eligible for
a permit to own a ham rig capable of
receiving police frequencies
Minnesota $ 10/free
Mississippi $15/
Missouri $15/15 Affidavit required stating that
Amateur holds an amateur license
Montana $ 5/ SGL is state legislator
Ham tags issued only to "conditional"
tags expire Dec. 31
Nebraska $9/5 Passenger, camper, or truck
Processing time--4-6 weeks
Nevada $25/free plus usual registration fee
New Hampshire Plates not available in NH
New Jersey $ 10/free more than one car can use a ham
call (e.g. W2WEC-2)
New Mexico* $ 3/3
New York $11/5 More than one ham call can be used,
but must be altered (KB1HQ-1)
North Carolina $10/ Bills currently in House and Senate to
raise the fee to $10.00 each year
North Dakota $ Free/ Free
Ohio* $ 5/free
Oklahoma* $ 2.70/2.70
Oregon* $ 5/free
Pennsylvania $ 20/free request for multiple plates (WA3IAO-1)
pending
Rhode Island $ free
South Carolina $ 1/1 Deadline: July 1 and plate is valid
starting Nov. 31
South Dakota* $ 2.50/2.50
Tennessee* $ free/free
Texas $ 2/1

Utah $ 5/none
Vermont* $15/15
Virginia $ 1/1 Amateur equipment must be kept in the
vehicle
Washington $ 6/free
West Virginia $ 5/ All plates expire July 1
Wisconsin $10/free
Wyoming* $ 4/4

>it secret.

I've had real good luck with a slightly modified technique. When I have to call 911, I identify myself as an amateur radio operator "Calling from a mobile phone" and ask if they can hear me all right. That usually keys 'em in to what's happening and everything is pretty good from there. I prefer to call the most appropriate agency directly (Fire/EMS for a major accident, cop shop for a minor with traffic obstruction) because they actually have hams in the dispatch center, and have no problem with am autopatch call...The 911 folks are a little less 'worldly'...

958. 12 volt DC supply w/ high current

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-07 19:23:25 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <7868@vela.acs.oakland.edu>
Source record: 295334
Cross-posted to: rec.radio.amateur.misc,sci.electronics

I want to build a 12 volt power supply for my amateur radio transmitter.
I need at least 2 or 3 amps. The easiest way would be to used the
7812 voltage regulator. The problem is that the 7812 can only supply
1.5 amps. Would it be possible to use two (or more) 7812s thus supplying
3 amps (or more). Basically I would build two sets of ripple filters and 7812
regulators. Then connect the outputs of those two in parallel. Would
this work? Would it mess-up the 7812's internal current sampling and
voltage correction? If so, how would I get around it? Are there any
other (easy) ways of obtaining high current that is regulated?

Any help would be greatly appreciated,

thanks,

Steve Kuo

Actually, if you parallel the regulators like that you'll lose voltage
regulation. While it may seem harmless in theory, in practice it is
dangerous to parallel regulators like that. It will work if the
regulators are perfectly matched, but in practice the 78xx types are
not screened to such exacting standards. You can compensate for mismatch
by placing very small resistors in series with the outputs (just enough
to make the output voltages identical, so the regulators don't "pull"
each other). Again, you lose the regulation.

A better solution to your problem would be to get one of the MC78T12(K,T)
regulators. The K suffix is a can package and the T suffix is a plastic
TO-220 package. The 78T series can drive loads over 3A. If you keep
Vin-Vout between 3 and 9 volts you can drive the regulators to about 5.5A
out at room temperature. The T series is designed with thermal overload
protection also. Be careful and calculate the power dissipation of the
regulator for your application.....choose an approriate heat sink, regardless
of which package you choose to use!

960. Mixers

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-08 01:49:00 UTC
From: nix%muppet.DEcnet@consrt.rok.com
Message-ID: <9107090201.AA08333@ucsd.edu>
Source record: 295358

A couple of questions about mixers:

1.) Does anybody have PRACTICAL experience with hot-carrier diode double-balanced mixers and, the proper way to terminate the ports?

Several authors (Hayward/Demaw) see to like diplexers on the output port, while others (Rohde) frequenty use "noiseless-feedback" active transistor amplifiers to provide a good 50 ohm termination.

2.) Where are some good references for active double-balanced mixers? I've found a two-part article by Rohde, back in the March & April 1982 issues of "Ham Radio Magazine" (`HR'), and would like some more references.

Just in the last 2-4 years, Oxner had an article in `HR', sort of an ad for some fancy quad-FET that Siliconix was producing (it made the cover of that issue of `HR').

Responses would be appreciated.

961. Parts ... Parts ... Who's Got Them? (!!!)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-08 02:04:00 UTC
From: nix%muppet.DEcnet@consrt.rok.com
Message-ID: <9107090202.AA08451@ucsd.edu>
Source record: 295362

Who carries the fancy FETs, DBMs, PIN diodes, etc ... etc ... that always seem to figure prominently in the technical articles in the ham magazines?

I'm especially perplexed by some of the FETs in the `U' series (U300, U310 ...); they're apparently the item of choice when building an active termination for some mixers.

Also, does Unitrode still produce the PIN diodes that have been shown in the `build-it-yourself' solid-state switching articles over the last few years?

Is it possible that there are enough builders/tinkers that read "Info-Hams", so that a maintained list of parts suppliers would be of value? (somwhat akin to the list of `elmers', that gets distributed every so often)

I know that there have been some listings of parts suppliers, here on "Info-Hams", in the past. Could somdbody please e-mail me that list?

962. Re: Denver Hamfest

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-08 02:59:12 UTC
From: jlfergus@isis.cs.du.edu
Message-ID: <1991Jul8.025912.4418@mnemosyne.cs.du.edu>
Source record: 295336

Someone had asked about the upcoming hamfest in Denver. Ok, here's the
details:

Location: Jefferson County Fairgrounds
15200 West 6th Avenue
Golden, Colorado
Day: July 14, 1991 (Sunday)
Times: 0800-1400 Mountain Daylight Time

Directions: If you're westbound on 6th Ave., get off on the Indiana Exit,
turn left, go to the second light, turn right, then after
about 1/4 of a mile, turn left into the fairgrounds.
If you're westbound on I-70 out of Denver (eastbounders
take the 6th Ave. exit and get off on Indiana and turn
right) take the Colfax exit, turn left. Go to the 2nd
traffic light (Indiana) and turn right, go under 6Th
Avenue and follow the above instructions (2nd light...).

Raffle Prizes: ICOM 735 and W2A Dual Band handheld.

Hope this helps

73, John KF0OU

963. RFD: rec.radio.announce

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-08 04:42:06 UTC
From: randall@Virginia.EDU
Message-ID: <b4sl#nh@rpi.edu>
Source record: 295337
Cross-posted to: news.announce.newgroups,news.groups,rec.radio.amateur.misc,rec.radio.shortwave

NAME(s):
either rec.radio.amateur.announce or rec.radio.announce,
(depending on consensus to be established during discussion period)

CHARTER:
Technical information announcements relating to radio,
particularly Amateur Radio and Shortwave folks.
No discussions.
Example topics include: Sun spot advisories
Amateur Radio Satellite status reports
Announcements of Amateur Radio expeditions
to normally unavailable "countries"
Announcements of Shortwave broadcast schedules
Frequently Asked Question (FAQ) postings

MODERATION STATUS:
MODERATED, in order to prevent discussions or out-of-scope postings.

A volunteer moderator is needed. Someone with reliable mail
links to/from the Internet is preferred. Sub-moderators might
also be a good idea so that people currently posting regular
announcements could legally continue to do so directly.

Send mail to: randall@Virginia.EDU if you are interested.

RATIONALE:
There are currently a fair number of postings in rec.radio.shortwave and
rec.radio.amateur.misc that are periodic announcements or information
bulletins of one sort or another (Sun spot status is one example, but
there are many others as well -- see above).

There is enough total traffic and enough announcement traffic in the
rec.radio.amateur.misc and rec.radio.shortwave newsgroups to make
putting these announcement postings into a separate newsgroup. That
would have several advantages, including:

1) the amount of traffic in the discussion newsgroups would be
reduced a bit making it easier on readers.

2) folks could easily scan the announcements without having to wade
through discussion postings of less interest.

3) one need not subscribe to both the shortwave and amateur radio
newsgroups in order to read the announcements. Currently some
are cross-posted while others are not.

Kill files aren't a complete solution, because many people are primarly interested in the announcements rather than the discussions. The inverse of a Kill file (one that only lets specified postings be seen) would work but isn't implemented in any widely distributed newsreader.

Ideally the new newsgroup would also have a mailing list version so that folks who lack access to USENET or prefer a mail interface could receive the bulletins without receiving all of the discussion postings. Ideally such a mailing list would be maintained by one of the groups moderators.

USENET PROCEDURES:
According to USENET rules, discussion MUST take place in news.groups but may also be cross-posted to other groups of interest. Please be sure any posted comments about this do appear in news.groups. The Followup-To: header has been appropriately set for this to happen.

Discussion will occur at least until July 21st. If a consensus has been reached that this is a good idea and a name preference is clear and (a) volunteer moderator(s) have been identified, it should go to a formal USENET vote at that time. DO NOT VOTE NOW.

I would prefer NOT to count votes for this. If someone else would be willing to do so if we get that far, PLEASE drop me an email note and indicate your willingness to count the votes. This should be someone with reliable email links (UUNET would be ideal :-).

964. APT-Sats: Status JULY 07, 1991

965. ICOM IC-W2E

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-08 08:57:22 UTC
From: dl3no@infoac.rmi.de
Message-ID: <1991Jul8.085722.9019@infoac.rmi.de>
Source record: 295339
Cross-posted to: rec.radio.amateur.misc,dnet.ham

I just returned from Berlin and got a new IC-W2E. This unit has
frequency limitations. Not useful while travelling abroad.

But: the programming tips for the IC-24AT apply. The receiving frequency
range can be increased by "B" and "#" keys while turning on for aircraft
band plus 740 to 940 MHz band etc. Also the extended ham bands can be
received. Cross band can be programmed by "funct" "5" and "D" while
turning on.

Now: the problem is, the HT will not transmit even not in the US ham
bands... Any ham out there, who can tell me, how to expand the xmit
also? (I get "off" displayed, when pushing the PTT.)

By the way: Upto now I did not make any hardware mods.

Any mail answer will be appreciated and possibly summarized here.

966. ICOM 24AT Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-08 11:38:14 UTC
From: darel@maccs.dcss.mcmaster.ca
Message-ID: <1991Jul8.113814.22055@maccs.dcss.mcmaster.ca>
Source record: 295292

I was wondering if anyone has any experience with upgrading the
original short stubby 24AT antenna (FA-1443BA) shipped with the
low S/N (mine is 3055) units. I was in a local radio shop
lamenting about the poor performance relative to the 32AT (FA-1443B)
antenna shipped with later models. The service person alluded
(albeit vaguely) to the fact that ICOM would exchange the
original for the FA-1443B at no charge.

Has anyone else has also heard of this offer or has
taken advantage of this and exchanged their original?

Darel.

967. DX Bulletin

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-08 12:52:19 UTC
From: skitch@NADC.NADC.NAVY.MIL
Message-ID: <9107081252.AA06701@NADC.NADC.NAVY.MIL>
Source record: 295343

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 018 (OPDX.018)
July 8, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, K1CC, WK3N, WA6AUE, NW8F, WB8LFO, K8MFO and VE3ICR for the following DX information.

3C0, PAGALU ISLAND (ANNOBON). It has been reported that a Spanish group will be going to Pagalu and may use the callsign 3C0CW. Operation will take place Aug. 6 thru the 16th. CW and SSB will be used, but no frequenies have been mentioned. CW QSLs go to EA3CW and SSB QSLs go to EA3CUU.

FP, ST.PIERRE & MIQUELON. FP5DX has been active on 14216 kHz around 0300z. He is slated to return to France soon for a new assignment. He will try for duty in one of the "FR" islands.

JY, JORDAN. Ray, JY9SR, continues to be active for about one week. He was heard all this week on 18073 kHz around 1900z and then again around 0200z. QSL via Box 354 Amman, Jordan. No IRCs Please.

SO, POLAND. Rich, K1CC, sent the following message to OPDX: "I will be active from Poland as SO3CC from July 3 until July 17, including single-op CW in the IARU HF Championship. If conditions are good (and they have been in the last 3 years!), this is an excellent contest with lots of DX activity. For that low-band multiplier, check 3510 at 0200z and 1830 at 0215z. I'll also be active as SO2CC, SO5CC and SO9CC before and after the contest. QSL via my home call. CU all on 6 bands! -- Rich K1CC "

SU, EGYPT. SU1HV was active this weekend on 21019 kHz around 0130z to 0230z. QSL via IS0LYN.

SV5, DODECANESE. As of Saturday, July 6th, Mike, SV0HV/9, has not started operating from SV5. It looks like he will try for July 10th or 11th. He was last heard from Crete on 21328 kHz around 0100z. QSL to KA5EJX.

QSL CARDS IN THE MAIL. As reported two weeks ago by VK4MZ, the first batch of HK0TU QSL cards were sent out. Now as of this past week some of the cards have been received stateside. Other cards that have been received this week: FR5AT/T (29 days), UZ2FWA (5 weeks), FT4WC (29 days).

QSLS FOR ZS9Z/1. Jim, WA6AUE, wants it known he is not the QSL Manager for ZS9Z/1. Cards are to go to Matti, OH2BH. Jim only distributes the QSL cards for the U.S. and Canada.

YA, AFGHANISTAN. Remember a team of four operators from Italy will be active from Afghanistan, July 12 to 29. Possible callsigns will be YA0AS or T6AS. Check for them on the following SSB frequencies: 3780, 7080, 14180, 18142, 21280, 24292 and 28580. On CW, look for them 1 KHz up from the bottom of the band edge. QSLs will be handled by Salvatore, IT9AZS. They will also be asking for extra IRCs, because the plane for the DXpedition will cost 16,000 U.S. dollars.

YS, EL SALVADOR. Tom, K8LA, will be active on all bands and operate both CW and SSB. He will be operating as YS1/K8LA until July 14. QSL to his home address.

ZA, ALBANIA. There has not been any more info to report about the possible operation by I3BZK and I3GJZ to ZA-land. Operation is supposed to start July 11.

160/80 METERS. Don, K8MFO, reminds us that people tend to stay way from 160 and 80 meters in the summertime. A lot of goodies are there to be had in the 0100 to 0300z time frame. Within the past couple of weeks, Don has worked the following:

160 meters - TU2MA on 1832 kHz at 0124z, LU8DNY on 1837 kHz at 0151z, several PYs at 599 between 0100 to 0200z.

80 meters - CX4SS ON 3507 kHz at 0117z, HF0POL on 3505 kHz at 0200z, OA4AMM on 3508 kHz at 0127z, TU2MA on 3510 kHz at 0200z. Also lots of loud PYs, LUs, etc. in the same time period.

Why the good stuff on 160 and 80 meters? Don explains, "Its winter time in the southern hemisphere and their QRN level is down. For us, things are not too noisy in and around our sunset. This makes for an ideal situation for us. Come and join the summertime fun on 80 and 160!"..... 73's Don K8MFO

THE WK3N WORLD DX NEWS.....
President Roh Tae-woo of South Korea told President Bush Tuesday he hoped to see the two Koreas reunited before the turn of the century. (GEEE! another new country?)..... Contacts from Mozambique, C9, may once again become rare as civil war rages there. Many thousands of refugees are seeking saftey in Malawi, 7Q7..... Yugoslavia's on again off again civil fighting continues, but on a brighter note Yugoslavia will now have 6 meters at 20 watts available to its hams...

LASTLY... I know this does not have anything to do with DX, but I would like to dedicate this bulletin to my mother who passed way this week unexpectedly. My loss was indescribable, but for my dad, it has to be unbearable. I feel in my heart that she has gone on DXpedition to a rare place, a place where not too many people get to go, and I hope that some day I will be able to meet her there. Until then, she will be missed.

Excerpts and distribution of The OPDX Bulletin are granted as long as
OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS
online at 216-237-8208 2400/1200/300 and leave a message with the
Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send
BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message
via packet to KB8NW @ WA8BXN.OH.USA.NA

968. Parallel Dipoles

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-08 13:03:00 UTC
From: JMG%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <82AE6B68C0000D3B@TNTECH.BITNET>
Source record: 295340

Help!!!! - Please.

I am somewhat confused. I bought a Van Gorden parallel dipole (10-20-40-80 with a balun). We cut it to the desired frequencies as the instructions stated. The antenna got my signal out all over the world with no problem, but my SWR was off the scale on all bands. I fooled with it and found I needed to add a lot!! of wire beyond what they and the formula suggests. Before I got the SWR down, the reflected power was reading about 300-500 watts (didn't sound right for a 100 watt rig)

I finally got the SWR down in a part of each band, but the part that the SWR is ok at is very narrow (small part of either code or phone). I put up my first regular dipole for 15 meters and with no problem got a good SWR across the whole band.

Is there something wrong with the antenna? are parallel dipoles really that narrow banded? could there be something wrong with the balun? how come I get such good signal reports and get out so well even though the SWR is so bad? Now that I am not getting all that reflected power, should I just buy an antenna tuner to get the rest of the SWR 1:1? Will getting the SWR down lower do anything but save my finals?

Thanks, as you can see I can surely use some help.

Paralleling regulators doesn't work very well, as has been discussed on sci.electronics before (Frequently Asked Questions list time?). My favorite regulator for ~3A is the LM350, which can be gotten surplus for a very few dollars (or new from Digikey for $6.75 for the TO-3 case, or under $5 for the TO-220 case which is harder to properly heat-sink), and guarantees 3A output (with sufficient heat sinking) and will supply up to 4A depending on the individual device. The LM338K is good to at least 5A, but is much rarer on the surplus market, so I usually add a pass transistor to a low current regulator if I need more than 3A (though they only cost $9, so if you don't have a well-stocked junk box and plenty of time, they're a quite reasonable solution).

The LM350 and LM338 are adjustable regulators, requiring a pair of resistors to set the voltage (and a few capacitors and diodes to cut down on noise and provide some safety), but this is a feature, since you'll be able to set the output voltage to 13.8 (nice fresh car battery voltage) which will boost the output power a little bit (and, depending on the final amplifier design, may boost efficiency a bit as well).

Note that you'll want about a 16V 3A transformer (good luck finding one). Radio Shack's 18V 2A transformers will work fine if you parallel two of them (as long as transformers are reasonably well matched they can be paralleled with no problem. To correctly parallel two transformers: (0) check the actual voltages of the two transformers (power the primary and put a 1K resistor across the secondary to provide some minimal load); they should match to within 10% or so. (1) solder the primary wires together to parallel the primaries, and put on a power cord. (2) temporarily connect the secondaries and a 1Kohm resistor as follows:

```
--------XX--------- E and 3 represent the secondaries, X and Y
E 3 are the "names" of the two secondary leads
E 3 (ignore any center taps). Basically, you
E 3 connect the two secondaries and the resistor
----Y-/\/\/\/-Y---- in series in a loop.
```

(3) Plug it into the wall, and measure the voltage across the resistor. If it is twice the secondary voltage, the secondaries are out of phase (and hence are adding across the resistor), so you should reverse one pair of secondary

leads. If the voltage across the resistor is near zero, the secondaries are in phase and the resistor may be deleted (solder together the two Y wires and use XX and YY as the new secondary output). If the voltage across the resistor is nonzero but low, then as long as it is less than about 10% of the rated secondary voltage, the transformers are matched sufficiently well.

Many thanks to whoever it was who first posted this technique.

>>other (easy) ways of obtaining high current that is regulated?

An easy way to improve the 78xx series is the following.
Put a 1 ohm resistor in the supply line (before the 78xx)
now connect a Base-Emittor of a transistor over this resistor, and
connect the Collector to your output. At about 0.6 A the resistor
will have a 0.6 volts drop over it. This will start enabeling the
transistor. This circuit defeats the thermal limitations of the 78xx,
to reenable them do this trick again (with a smaller resistor (calculate
from the max current you want to build this thing for)), but
now connect the Collector of the transistor to the input of the 78xx,
so now the excess current will flow into the 78xx. With about 1A more,
the 78xx's currentlimit will start to work, and you won't be able to
draw more than the max current!

971. DJ160 variations...

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-08 14:55:31 UTC
From: hugh_davies.wgc1@rx.xerox.COM
Message-ID: <".8-Jul-91.15:55:31.+1".*.hugh_davies.wgc1@rx.Xerox.com>
Source record: 295342

As recommended by various people on this DL, I bought an Alinco DJ160T whilst on vacation in the USA. I'd just like to say "Thanks" to all who recommended it, as it's a super rig. Just a few more questions...

i) Has anyone fitted a 1750Hz toneburst to one of these? If so, is it the kind of job a fumble-fingered, hardware illiterate person (i.e., me) could attempt, or shall I send it in?

ii) The rig advertised here as the DJ160EA covers 108-174MHz, whereas mine covers 130-174MHz. Is there any good reason for this? Also, the rig here has AM, and mine doesn't. Is it possible to add AM and the extended coverage? (I want to listen to the airyplanes too!).

iii) The socket on the side marked 13.8V. The manual (Hah! Now I see why people complain about the Alinco manuals!!) says this is 13.8V OUT "to power accessories". Surely not? Isn't this to feed 13.8V IN so as to drive the rig from a car power supply? Or have I got it completely bass-ackwards?

iv) Is there a service manual for the rig? Is the English as bad as the Operator Manual?

Anyway, thanks again!

73,

Hugh, G0CNR

RACESBUL.177 DATE: July 8, 1991
SUBJECT: Equipment for emergency responders - Part 5

Carry matches. I don't smoke and have been caught out needing
a campfire, only to find I didn't have any matches. A muzzle
loading pistol was used to start a fire to dry my wet clothes and
cold body on one of my outings.
I carry a tool kit with a supply of connectors and terminals.
If you use cables to connect any of your gear you should have
spare cabling or the parts and equipment to make field repairs.
I carry some solder and a propane powered soldering iron. This
has saved the day on several disasters.
I am sure that you can add to my list. The intention of this
article is to give you suggestions and make you think of things
you will need when you respond to an incident. You can be called
on to supply mutual aid communications for other agencies.
Be flexible. To borrow a concept from the Boy Scouts, "Be
Prepared."

>carry them.

Sure they do. You just have to know where to look :-)
Part # 274-373 is an adapter that converts a 1/8" stereo plug to a 3/32" one. You can either use this with a 1/8" plug or chop it up to get the 3/32" male half. Actually, you can use a mono plug for the mike, if you don't mind wasting a little power. The sleeve contact is used to feed +5 (through a 470 ohm resistor) to supply power th 3-terminal electrets. A mono plug will just short the other end of the resistor to ground.

Parallel Dipole SWR Problem

Maybe it is too close to the ground

I don't know how much power you're running but I suspect you could be reading the wrong scale for reflected power.

Lots of reflected power probably also means a lot of radiation from the feed line which falls on you. I would at least use a tuner.

>>could hear the other 440's operating no matter what frequency you were on!
>>This lead us to believe that it was IF leakage from rig to rig.. on both
>>SSB and CW every band and mode each 440 op could hear the other two almost
>>exactly on frequency.. it was most disturbing!!!

We used to have this problem in a big way. A couple of years ago we were
determined to lick it. We spent considerable effor designing all sorts
of bandpass filters to put in line to elminate the noise.... They just
didn't do a thing (except add insertion loss). Then while experimenting,
we discovered what *really* made a difference... A good ground at each station.
Since then we've had little trouble. Oh, you can hear a bit of 'rushing' sound
if one station is on 20 ssb and the other on 20 cw, but its only S-1 or 2.
We've used our TS-440 with TS-430's and and IC-735, with good results.

Of course we also strive for as much physical separation between the
stations and their antennas as possible. A couple hundred feet seems to
work ok.

Returning to reality for a moment...

The size of filters has a lower practical limit. (Ever wonder why your HT has intermod problems ?)

I'm sure there are a few other components (like RF finals) that have the same problem. The VXO/PLL would probably be squirrelly with all the heat packed into one place - nothing like transmitting and QSYing at the same time...

#ifndef REALITY

What I'm waiting for is a VHF/UHF/SHF rig that can cover as many octaves as an HF rig. Lessee, that's .144 - 2.5 GHz.

rec.radio.amateur.bulletins would be more to the point.

> Example topics include: Sun spot advisories
> Amateur Radio Satellite status reports
> Announcements of Amateur Radio expeditions
> to normally unavailable "countries"
> Announcements of Shortwave broadcast schedules
> Frequently Asked Question (FAQ) postings

I would add:

AMSAT Reports
SpaceNews
All ARRL Bulletins
FAQs from all rec.radio groups
New equipment reviews, including modifications
New software availability
And possibly Convention (hamfest) announcements.
(I do not read rec.radio.shortwave, so I did not include
any subjects from there)

>MODERATION STATUS:
> MODERATED, in order to prevent discussions or out-of-scope postings.

Could be unmoderated for the time being. Facilitates speedy information
flow in case of an emergency announcement. If this becomes a problem,
moderation could occur at a later time.

On my TH-77A, I found that the problem was cured with a VFO reset
(preserves the memories!) and didn't need a full processor reset.

By the way, anyone noticed that the displayed memory channel and
the actual frequency used sometimes get out of sync (eg: audio is
from channel 5 but display says 6)? Seems to be related to doing
a band switch while the band is scanning, but with only the MAIN
band enabled, and using the selector knob to step past an active
channel - I haven't fully characterized it yet (it usually
cures itself with a power off/on or guaranteed with a VFO rest).

In this case, it should be moderated. Everyone has their own idea of what constitutes an 'announcement' [I have the following equipment for sale could be considered as an announcement by someone.] Most of the .announce groups are moderated for a very good reason, they should only be used for announcement and not for discussion. If the group is not moderated, discussion will take place whether desired or not.

You might want to check and make sure that you really need 3 conductors. As far as I know, all ICOM HTs use the same standard interface - just two wires. When the radio sees a low impedance between the two contacts, it goes into transmit.

I have used a Radio Shack 2-conductor plug to interface to my ICOM IC-32AT, as well as my Yaesu FT-727R. I know that the standard ICOM speaker/mike uses only two conductors as well.

989. Need Info on Haitian hams (packet routes, rules, etc.)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-09 01:00:02 UTC
From: Postmaster@pscs.uucp
Message-ID: <01010026.6xm9co@pscs.uucp>
Source record: 295371
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy

Hi all;

I am looking for information about Amateur Radio in Haiti. A
local elementary school, which I volunteer for, has a sister school
in Haiti. I would like to try to bring these two different worlds
together through (you guessed it!) amateur radio. Specifically:

o Does the USA have a third party agreement with Haiti?

o Do you know of any active Hams in Haiti? (please send callsign)

o Are there any good packet radio links to Haiti? (please send call)

o Do you know of any Amtor BBSes in Haiti? (please send call)

We will have a station in the Washington, D.C. area and hope to work the
Haitians via 2 Meter packet radio (just for sending mail!), and 20 Meters
Voice and Packet (perhaps Amtor as well). Once things are going more
smoothly we might consider slow scan TV as well.

Any information about Haitian amateurs and amateur radio in Haiti
would really be appreciated. Also if you have helped to set up a
radio station in a school (especially a grade school) I would
like to correspond with you and find out about your experiences.

To reply to this letter please use the addresses below,
Internet/UUCP is preferred because it is faster. Thank you.

990. Re: was 5/8wave Question; now 1/2 wave questions

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-09 01:56:39 UTC
From: rwp@hpfcso.FC.HP.COM
Message-ID: <103360027@hpfcso.FC.HP.COM>
Source record: 295367

> The problem with a 5/8 wave ground plane on 2 meters is that if you
> mount the thing on the roof of your car, you can't get it into the
> garage. So most people end up mounting the antenna on the trunk.

I and Everyone I know that has a single band 2m rig has a 5/8 wave.
They all mount it on the roof. I do not have a problem getting in and
out of the garage. In fact the sound of the antenna bouncing around
past the door tells me when I am in far enough. :-) But the whip is
very flexible and it does not cause any problems at all.

For others on the net, don't let the idea of a long whip and the
garage turn you off to it. Unless you have a tall van most normal
cars and garages should work fine. The 40m HF mast/coil/whip on the
bumper is a different story, however. :-)

991. Identifying commercial repeaters via Lat/Lon info

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-09 01:57:59 UTC
From: thompson@cactus.org
Message-ID: <7996@cactus.org>
Source record: 295361

I would like to identify a commercial/state government repeater
by searching the FCC data base via Latitude/Longitude.

The reason is simple. I have a handheld LORAN unit which can
give latitude and longitude. Does anyone out there have an FCC
database that can be searched in this fashion? Seems like a
nifty way to identify commercial repeaters.

Thanks in advance,
Charlie Thompson

(stuff deleted)
The ECG 933 is a TO-3 style regulator that delivers 12 volts at 5 amps.
It is available widely as most parts stores stock the ECG line.
Also, the ECG 934 is 13.8 Volts at 5 amps, which is probably what you want.

The availability of the parts in ham magazines is quite variable. Some
authors go to great pains to ensure that their article uses commonly-
available parts; others use a "sample" that is on-hand, even if it
is not easily found.

Chapter 35 of the ARRL Handbook has a list of parts suppliers. It is by
no means complete. We include only those firms that are willing to deal
in small quantities, reasonable minimum orders, etc. A no-charge copy
of the list is available from our Technical Department Secretary. Please
include an SASE and ask for the "Chapter 35 Parts List".

>I'm especially perplexed by some of the FETs in the `U' series

These devices are made by (Information from the 1989 Gold Book):

Siliconix, Inc.
2201 Laurelwood Rd
Santa Clara, CA 95054
(408) 988-8000

The Siliconix factory Marketing Department should be able to give
you the name of a distributor.

The U309 and U310 are available from (Info from Tech Dept files):

RF Parts
1320-16 Grand Ave
San Marcos, CA 92069
(619) 744-0700

>Also, does Unitrode still produce the PIN diodes that have been
>shown in the `build-it-yourself' solid-state switching articles
>over the last few years?

I am not sure if Unitrode still produces the PIN diodes. They can be
reached at (information from the 1990 IC Master):

Unitrode Integrated Circuits Corp.
7 Continental Blvd.

Merrimack NH 03054-0399
(603) 424-2410

The 1N5767 PIN diode is often found in TR switch projects. Surplus
Sales of Nebraska sells the HP5082-3080, a replacement for the
1N5767. They also have numerous other solid-state devices.

Surplus Sales of Nebraska
1315 Jones St
Omaha NE 68102
(402) 346-4750

>Is it possible that there are enough builders/tinkers that read
>"Info-Hams", so that a maintained list of parts suppliers would
>be of value? (somewhat akin to the list of `elmers', that gets
>distributed every so often)
>
>I know that there have been some listings of parts suppliers,
>here on "Info-Hams", in the past. Could somebody please e-mail
>me that list?

Please send it to me, too. I am compiling a complete list for the
ARRL files and would like to know as many as I can find. I will
post the complete list when it is finished.

In general, parts locating can be a real chore. My suggestion is to
collect catalogs and sources *before* you actually need the part for
a project. The catalogs here in the ARRL Lab were gathered painstakingly
over the past years -- a never-ending project! If you want to have the
information at your fingertips you will need to do the same.

996. Phase Noise, the Ten-Tec approach

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-09 07:49:09 UTC
From: dana@locus.com
Message-ID: <1991Jul09.074909.2829419@locus.com>
Source record: 295375

Some time ago, I posted to the net regarding phase noise, mentioning that
Ten-Tec appears to use a 220 Mhz synthesizer with a 400 Hz step and divide
the output by 40 to get a 5 Mhz VFO with a 10 Hz step and good phase
noise characteristics. Some other person posted saying it doesn't help
phase characteristics to synthesize at a high frequency and then
divide down. I'm not convinced.

Let's think of the net result of phase noise on the period of
a waveform as a random amount ranging from -1 to +1 Nameless Units (NU).
Then, the actual period is K Nameless Units. Thus, each period is:

P = K + x

where:
K = period
x = evenly distributed random number [-1..+1]

Then, multiplying this period by, say, 40 (same as dividing frequency by 40),
yields:

40P = 40(K + x)
40P = 40K + 40x

Since x is not the same value for each of the 40 values added
up, but is instead an evenly distributed random number that will
tend to add up to 0, we can write:

40P = 40K

It seems that dividing the synthesized frequency does tend to
reduce the phase noise component, given the component is centered
around 0 degrees and is symmetrical.

My question is: why isn't this valid?

>(preserves the memories!) and didn't need a full processor reset.

Me again. Turns out there is some power-on software switch that
apparently got hit, DUAL-power on. This switches the main band receiver
between the internal and external speakers. Just toggling that would have
done it. I don't know how that bit got set to begin with, though.

Does anyone know a way to enable a sidetone? Using a headset on
simplex VOX, there's just no way to tell if you're transmitting--the
earpiece is silent all the time. Voice feedback like a telephoen would
be a great help.

I have recently been looking for Unitrode pin diodes. Unitrode still exists
and they still produce pin diodes. I called Unitrode in Mass. (I can't even
spell it, that state were boston is found) and got faxed some data on the
the 1N5767 familly.

I have the address of Unitrode at home and I can pass it on if you ask me.

I still don't have a Unitrode supplier but Hewlett Packard make a nice
assortment of PIN diodes and I compared specs and called them. HP sell their
components (at least in Canada) through distributers so try calling the nearest
HP district office and asking for the name of the distributer and try begging
for their semiconductor catalogue. HP also has a series of application
notes which could add new grist to your double balanced mixer quandry.

Any suppliers of Unitrode or HP who accept piddling little orders?????

Source record: 295299
Cross-posted to: news.groups,rec.radio.amateur.misc

After severely trashing this idea in news.groups, I've come to realize
that the proposal would be far less objectionable if the following
things happened:

1. That a committed and respected moderator was selected (I'm already
quite taxed with work, grad school, my info postings to the group, and
UNO-ACM, unfortunately). I have sent E-mail to 1 or 2 people that I think
would be perfect for the job.

2. That in addition to a passive role (i.e. accepting submissions) the
moderator took an active role in selecting informational posts from
the established newsgroups and passed them along to the *.announce group
unchanged. This would eliminate a LOT of the drawbacks of crossposting
problems, editorial control, and time delays inherent in a moderated
group. It would also eliminate the need for information posters to
have moderator privileges, which would be confusing and VERY HARD to
successfully implement..

This would also not stifle experimental and small informational postings,
since they could develop themselves in the mainstream groups and be eventually
selected for *.announce when they are properly polished.

There is already a Usenet precedent for this in sci.space. In addition to
the SPACE-L mailing list, which is a full echo of sci.space, there is also
a moderated SPACE-DIGEST list made up of sci.space minus the flamage,
meta-discussions, go-nowhere threads, and "me-too" postings.

This would still result in the informational postings still appearing in
the other groups, but would be a far preferable solution to the original
one proposed.

Source record: 295282

Hello,

I'm interested in charging an HT's battery pack (any HT, I haven't got one yet) with a solar cell. If you insist on specifics, I'm looking at the ICOM IC-24AT and the Yaesu FT-470. (Of course I'm VERY open to suggestions.)

What is the average size, voltage, mA, wattage, charging rating &c of a HT's battery? Right now I'm looking at Solarex's MSX-lite series. They produce a 5watt 126mA cell for about $90. Has anyone had any experience with them? I've contacted other companies (the net supplied a list) however, three people suggested I look at solarex because of their durability. (This thing is going to be mounted on a bike.)

I realize that some of these questions sound real dumb, however I've got no ham buddies around. *sniff* But I do get to go to my first ham fest this weekend!

Thanks Much,

Jonathan Bucki

Source record: 295278

Several yars ago I built up a tone burst generator
prior to a European trip. I used the same
schematic ICOM
uses in their 2AT d schematic.

I wrote it up for Ham Radio (approx 1984). I'll be away for several weeks
but if anyone wants the schematic I can send it
to them when I return home.

The device was built in an old pager case and had an output
to the mike jack on the 2AT. The internal mike is not
disconnected when tan external mike is used
so I would hold the ptt lever, then put a burst.
Worked like a charm.

BC200XLT SHORT BATTERY LIFE SOLVED

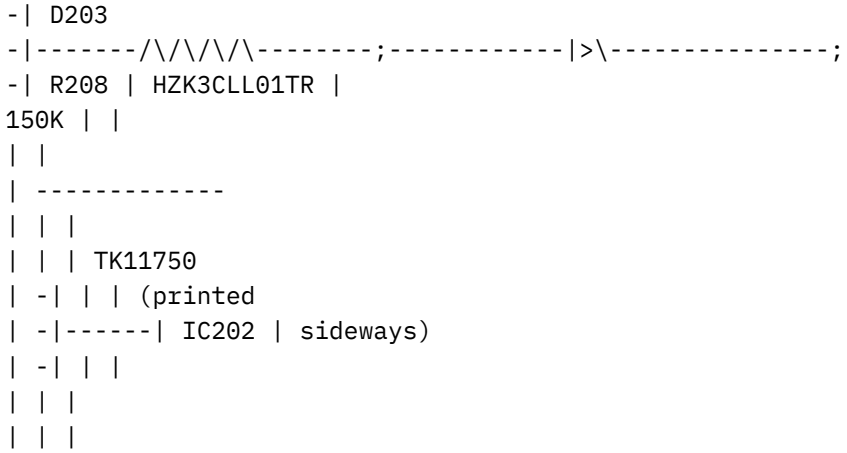
Short abttery life--sometime only an hour or two between charges--seems to be
the only major complaint amoung owners of the laeading hand-held scanner, the
Uniden Bearcat BC200XLT. Presumably, owners of similar sets like the BC100XLT
BC205XLT, and Cobra 4030 could have the same problem. Now that is an ailment of the past.

It turns out that the batteries were not really at fault; a zener diode which
determines the voltage at which the low-battery indicator would come on was
defective in some units, causing the circuit to actuate prematurely. Replacing
that idode and changing the value of an associated resistor provides the answer.

FREE FIX

MT contacted Uniden and was assured that they will provide the fix for free,
even if the radio is outside of the one-year warranty period. If your
Uniden BC200XLT suffers from short battery life, send the radioo along with
a brief note describing the ailment, to Uniden Customer Service, 9900 West
Point Drive, Indianapolis, Indiana, 46250.

As shown in the accompanying diagram, zener diode D203 and resistor R208
are the parts in question. D203 should be about 7 volts and R208 should
be 150,000 ohms. These are miniature surface-mount devices on double-
sided circuit board; if your radio is under warranty, attemping this fix
yourself will void that warranty.



| -------------
|
|
|

SHORT CUT

Mark Machcinski of Wyandotte, Michigan, came up with hisw own solution. He simply soldered a wire bridge across diode D203, disabling the low battery indicator entirely. The radio now operates uninterrupted until it blanks out when the abttery level drops to about 4.5 volts.

Yet another suggestions from a Canadian reader would bridge the original diode with a 6.8K resistor, defeating the premature recharge signal, yet preventing the battery from too low a discharge.

From MT
June 1990, page 98
Bob's Tip of the Month

BC200XLT BATTERY LIFE EXTENSION: Part II

Every time we run a helpful hint on a popular product, someone find an even more helpful hint! This one disable the low battery cutoff circuit and adds several hours of operation to a single charge. Our lab unit was still going strong after seven hours straight! Uniden will provide the fix for free, but if you're in a hurry and don't mind voiding your warranty, read on!

NOTE: This modification should not be attempted by anyone unfamilier with small circuit oard components.

The tools: You will need a small Phillips screwdriver, fine-tip soldering iron and solder wicking braid.

The procedure: Remove the battery pack, then the two screws form the bottom spring clip. Carefully pull the rear cover off, bottom first. Remove tjhe two small screws at the base of the circuit board. Pull the front panel away from the mainframe, bottom first.

At the bottom of the remaining board--to the left of the speaker magnet--are two blue electolytic capacitors; just above them are two striped components--one resistor and one diode. Using the soldering iron and braid, carefully remove the two components without overheating the board or damaging the copper traces.

When you reassemble the radio, be very carful to note the insertion of the front panel into the slot at the base of the volume/squelch panel. Be especially careful to align the screw holes perfectly, allowing the two rows of fine pin contacts to mate correctly with the socket. If this is not done correctly (and it probably won't be the first time!) no damage will occur, but the scanner display will be blank.

Recharge your batteries after 6-8 hours of heavy use. If the scanner dies, recharge it as soon as possible to prevent loss of your memorized frequencies.

Source record: 295280

Does anyone recall any articles from the amateur magazines, or have a reference to a text with introductory descriptions and recipies for using Smith Charts. Some of the curt items I have read seem to expect you to fully understand them before they describe them to you.
The description in the ARRL Handbook of use in matching a device in a preamp will eventually be useful if I can get the basics out of the way first.
Thanks in advance

In article <1991Jul10.194520.2801793@locus.com> dana@locus.com (Dana H. Myers) writes:
] If the phase noise of the VCO at 220 Mhz is similar to the phase noise
]of a VCO at 5 Mhz, and the higher reference frequency (400Hz vs. 10 Hz)
]contributes to better suppression of the phase related noise, then the
]synthesize high/ divide down approach would be superior.

A phase locked loop is a feedback system. If the bandwidth of the loop
is high, the phase noise itself is suppressed by the feedback. On the
other hand, increased divide ratios (required for narrow frequency
resolution) decrease the bandwidth. I am referring here to divide ratios
IN the feedback loop, not dividers after synthesis (as described in this case).

If one synthesizes at higher frequencies, one can use a higher loop
bandwidth for the same number of frequencies synthesized. Since the
phase noise tends to be 1/f noise, this higher loop bandwidth inhibits
more noise. When one then divides the frequency down, the phase amplitude
of the phase noise is then reduced even more (by the divide ratio). Thus,
it looks to me like synthesizing and then post dividing is a good idea.

Assuming both oscillators use resonators with the same Q, and assuming
loop bandwidths are proportional to frequency, then I believe the
higher frequency vco will have higher phase noise proportional to
frequency. So there would be no difference between the 5 MHz vco and
the 200 MHz vco divided by 40.

One advantage of the 200 MHz option is that the wider loop bandwidth
gives you faster lock-in time. (Tnx to N6GN for this observation.)

1015. Major Solar Flare Alert - 11 July - Impact Possible

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-11 18:12:17 UTC
From: oler@HG.ULeth.CA
Message-ID: <910711121217.21c019c6@HG.ULeth.CA>
Source record: 295295

-- MAJOR SOLAR FLARE ALERT --

JULY 11, 1991

Flare Event Summary
- Low to Moderate Impact Possible -

MAJOR ENERGETIC EVENT SUMMARY

A major solar flare erupted from Region 6703, located at N22W51. The event began at 09:28 UT, peaked at 10:37 UT and ended at 11:03 UT on 11 July. This flare was rated a class M7.3/3B event. Radio emissions were not particularly rich. There was no tenflare and the 245 MHz emission was only measured at 88 sfu. A Type II sweep frequency event was observed with this flare. A Type IV was not present. This long-decay event was sufficient to produce a moderate intensity SWF over sunlit sectors. This, combined with the relatively weak condition of the ionosphere may have had a serious temporary impact on HF propagation over many middle and low latitude regions.

Region 6703 has continued to decay. Since the large class X1.9/2B flare of 07 July, this region remained relatively quiet.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

There is a risk for a low to moderate terrestrial impact from this flare. An interplanetary disturbance could arrive anytime after approximately 09:00 UT on 13 July. If a disturbance does arrive, conditions are likely to remain generally active or very active with a few periods of minor storming over the middle latitudes. High latitudes may observe more frequent and intense periods of minor storming. The probability for observing a terrestrial impact is approximately 60% for 13 July, which implies there is also a healthy chance that we may not witness an impact.

Middle and low latitudes are not expected to be seriously affected. The high latitude regions should experience the worst conditions if an impact materializes.

I have run accross a bit of a problem and I thought that maybe one of my fellow hams might be able to help me.

Here's the scoop. I recently had some construction done in my home. During this construction the location of my stereo center was changed. Unfortunately, I did not dot my "i's" and cross my "t's" and I forgot to include in the plan re-wiring the speakers in my bedroom and living room.

Unfortunately, post-construction, there is no easy way to run wires accross the house from my receiver to my speakers. I suddenly had this "bright idea".

I had heard that there are devices on the market that you attatch to your receiver which transmit using low power output to another device that you attatch to your speaker in another room.

Does anyone here know about any of these types of devices ? What are they called ? Where can I get one ? How much do they cost ??

Please email me back replies and I'll summarize back to the net.

It will be better close to the carrier (within the PLL bandwidth). However,
the important issue in an HF radio receiver (where you want high adjacent channel
selectivity) is the noise 5 to 50 kHz. away from the carrier, and this is
not affected by the PLL bandwidth. It is entirely a function of the VCO noise
in the architectures normally used in ham equipt.

Re: higher current regulators

In "wraparound" regulators that use a conventional 78xx driving a pass element (I like the D45H5 myself), one trick that thermally protects the pass element is to mount it physically close to the 78xx. When the pass element gets hot, the 78xx gets hot, folding back the whole thing.

Stu,

I know the ARRL's new Microwave Handbook has a good 4-6 pages devoted to using the Smith Chart. Another good ham reference is the article which appeared in some issue of Ham Radio Magazine in the late 70's/early 80's, which I have at home but don't recall offhand. Both discuss the use of the chart in real-world terms, explaining how the chart is helping you "get from there to here," as it were. The ARRL book also gives a somewhat less clear introduction to S-parameters.

Many introductory microwave textbooks give the Smith chart a good going over, but the treatment from book to book is variably clear. A visit to a technical or student bookstore (giving one's self plenty of time to browse) might be profitable. Make sure the book's treatment is at least accessible by you, with lots of examples involving different kinds of transmission lines and lumped elements.

Lotsa luck,
Marshall Jose WA3VPZ

re: encapsulation material removal
Thanks to the many replies in answer to my origional request.
Maybe a bit more detail on what i am trying to remove the encapsulating
or potting compounds from may put a different light on the subject.

The units I am interested in getting at to repair are used on outboard
motors and motorcycle/cars etc.

Some units are built into tough 'plastic' type boxes or diacast metal
boxes usually with the bottom open and when the circuit board and
components are fastened in then a material is poured in to protect
them from the elements and I suspect me.

I have tried several solvents including toluene (not sure of spelling)
which will bubble the material allowing scrapping away bit by bit a
very slow process.

Other solvents will usually do damage to the insulation used on the
wires and in some cases the boxes (PLASTIC).

This is surely making the original request more difficult but we live
in the hope that some enterprising person out there can help.

Brian

1022. Re: Parallel Dipoles

>I am somewhat confused. I bought a Van Gorden parallel
>dipole (10-20-40-80 with a balun).

I don't know what this beast is, but I can guess. The bandwidth of an antenna varies directly with it's relative diameter (D/wavelength). 80 meter wire dipoles have very narrow bandwidth, perhaps as small as 50 KHz at the 3:1 points. My HF6VX vertical is about 100 KHz on 80 for a 3/4" radiator.

The badness of SWR is highly overrated. However, in your case it shouldn't be that high. One good thing about high SWR (if there is anything good about it) is that it shows you that you don't have much ground loss, which would tend to push the SWR toward 1:1.

You don't mention how much "a lot" of additional wire you had to use. An extra quarter wavelength ? You may have a bad balun - try connecting a dummy load in place of the dipole legs and checking the SWR at low power. I assume it's a 1:1 balun, so a 50 ohm 2 watt carbon resistor works well.

>Jeff M. Gold KD4AAE/AE

1023. 12/17 and 160 for HF6VX ?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-11 21:28:12 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <39910082@hpfcdc.HP.COM>
Source record: 295302

Anyone out there buy the 12/17 meter mods for the HF6VX ? After considering how easy their 15 meter trap is to understand, I'm wondering if the WARC mod looks like it or if you actually get more coils and caps.

I'm also considering the 160 meter mod, but wonder how well a 33' radiator does on that band. Is it worth the money ? There is no way I can put in an "adequate" groundplane for 160.

How much actual operating have you done? Despite my later wish list, its
better if you get some good, but used and cheap equipment to start with.
Maybe you can find a local Elmer...

2. I have allocated (my wife disagrees) about $2000.00 for the
investment.

Oh, she thinks you ought to spend more, you lucky dog. :-).

3. I currently have interest in CW/SSB/RTTY (no packet).

I think it would be hard to beat the Icom 735 transciever $1000.

the Astron 35 is supposed to be a good power supply, better and cheaper
than Icom's

I don't know too much about tuners, but the Heathkits, if well constructed
should do you fine. You might be able to find a good one at a swap meet.

A good keyer, maybe a keyboard for CW would be in order $200.
A good microphone $100.

What kind of real estate do you have? Wire antennas are cheap, but they do
take room, and the higher, and more in the clear, the better.

4. The only limitation aside from the $$$$ is no tower or beam.

What are your suggestions. Rig/Power Supply/Antenna/Tuner...etc

Hello again,
As U all have no doubt have guessed I have an IC-W2A. What I am
particularly interested in is getting the VHF receive sensitivity
useable down to 70Mhz. At the moment the receiver is virtually useless
below around 120Mhz & I want to change this so I can listen to
activity on 75Mhz, 82Mhz, 106Mhz etc. What I need to know is technical
info on the VHF low pass filter immediately before the VHF RF amp &
also on the band pass filter immediately after the VHF RF amp. I would like
to know their cut-off frequencies/pass frequencies etc with a view to changing
some inductors or capacitors to enable receive down to 70Mhz. The New Zealand
ICOM agent cannot supply me with a service manual or any technical documentation
component location diagrams etc. or assist me in any way. I wonder if a
service manual or any technical documentation is available anywhere,
& if it is can someone send copies to me so I can pursue this. If you cannot
help, can you pass this request onto someone who may be able to assist me.
Thanks in advance

> power supply to change the dial setting.
> AL N1AL
Was the a "Larsen E. Rapp" article? The one I remember the most was
the "Q Multiplying VFO", which was claimed to be so stable that
merely rotating the shaft on the variable capacitor didn't change
the frequency of oscillation ! Larsen, however, intimated that
possibly the rubber tubing used for shaft coupling might have
had some bearing on this.

Another was the "Little Professor" article. This was a remedy
for people borrowing your test equipment. The "Little Professors"
came in different models and turned out to be carbon resitors which
you soldered across the AC line inside the piece of gear before
allowing the "buddy" to borrow it. If you just wanted to make
sure that it was returned, you put a resistor that just drew
enough current to warm up and smell a little like the gear was
going to fail soon. If you really disliked the guy and wanted him
to quit borrowing your stuff, you put something like a 10 ohm
2 watter across the line. Pfsssst..flash...smoke... 8-) .

>

There is no 10 meter capability onboard AO-13. Mode B is what AO-13 spends most of its time in according to the orbital predictions I run here. Mode B is 70 cm uplink and 2 meters down. Other modes in use currently on AO-13 are S, L, JL, and LS.

>I'm trying to figure out what bare minimum gear to get to utilize

>P.S. I have used RS-10/11 in the past with 15 up/10 down. It's
>neat, but it's not visible very long!

Well, if you have been on RS-10/11 you have the HF gear, so all you need now is some 144/435 Mhz multi-mode stuff. The ARRL has a satellite handbook you can order, or contact AMSAT for further info on getting on the birds. Also, there is a satellite communications column in QST on an "almost" monthly basis which covers much of this information.

Hope this helps you.

> clock and divide it down!

Yes, it is true the noise will be lower at the output of a divide-by-40 circuit that the input. The point is, however, that if you build a 5 MHz. VCO, you do not need to ever run the signal thru a digital device on its way to the mixer LO terminals. This will always give the advantage to the non-divided architecture because no digital divider (that I know of, at least) is as quiet as a good oscillator/buffer, in terms of phase noise floor. Even if you divide the 5 MHz. frequency down to run a phase detector, that will only raise the noise floor within the loop bandwidth, where it usually can be tolerated.

>
> Varactor-tuned Pierce oscillators usually have decent phase noise.
> CD4046's do not!

Yes, please do not pollute the spectrum by using gate oscillators including the popular 1648 and 1658 in a transmitter VCO. For a good treatise on this see Ulrich Rhode's books on synthesizers and receivers.

Even if the size of the random component is 40 times greater, it is
still an evenly distributed random number. Therefore, I maintain that
integrating 40 of these random trials still ends up in a much smaller
value than any one of them, and integrating a lot of them approaches
zero.

1032. Need procedure for U5MIR BBS

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-12 03:43:13 UTC
From: john@anasaz.uucp
Message-ID: <1991Jul12.034313.20439@anasaz>
Source record: 295318
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

Can anyone tell me how to leave a message on the U5MIR bbs? What
command to leave the message, and how to terminate the message,
and anything else needed to leave a message on the BBS for U5MIR?
Also, how to read the BBS.

Thanks in advance.

1033. Ham Radio Phone BBS List 7/91

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-12 06:29:57 UTC
From: TWB0@NS.CC.LEHIGH.EDU
Message-ID: <9107120533.AA11913@ucsd.edu>
Source record: 295294

Subject: Ham Radio Phone BBS List 7/91

The following is a list of some telephone BBSs that support Amateur Radio.
Some of these are strictly for hams, while others support special interest
groups for hams or have radio-related files or message sections.

Due to the increasing size of the list, it will only be distributed on the
packet networks once or twice each year as a multipart bulletin. If you do
not receive the complete list, please obtain it from one of the following
sources; duplicate copies cannot be sent out on the packet networks.

Internet: wsmr-simtel20.army.mil - PD1:<MISC.HAMRADIO>HAMPHONE.91A
wuarchive.wustl.edu - /pub/hamradio/hamphone.91a.Z
Phone BBS: K4NGC BBS (703) 680-5970 - HAMPHONE.91A (in 'miscprgs' area)
WB2COY BBS (914) 485-3393 - HAMPHONE.91A
Packet: KA2UGQ-4 BBS 145.01 MHz - GENERAL HAMPHONE.91A

If you call a BBS on this list and find nothing to indicate it's relationship
to Ham Radio or find that it has been disconnected, please let me know so I can
archive it and clean up the list. I can't gaurantee the accuracy of this list,
but I do strive to keep it as up-to-date as possible. Please send any updates,
changes, or comments to me. 73, Tom Brown KA2UGQ.

Packet: ka2ugq@ka2ugq.nj.usa.na

AXH113@psuvm.psu.edu (Azmi Hashim) writes:

>I'm looking for someone who can give the procedure to legally bring radio stuff
>like Ham/CB transceiver to Malaysia. I heard that I have to apply for an Approv
>al Permit (A.P) from Syarikat Telekom Malaysia Berhad (STM) and the A.P. can
>only be issued in Malaysia. So, if someone have gone thru this procedure, or
>have a copy of STM address, please send e-mail to me. Thanks.

In order to bring radio communication equipment back to Malaysia, you
first have to have an ammetuer radio license. Without this STM will not
issue a permit.

Even with a license, STM will require that all r/c equipment be checked
by them so as to ensure they comply with their standards. This will take
time. On top of that, you'd have to pay them a fee.

Once, I brought a 3/4 wave length CB antenna back and the authorities at
Subang confiscated it on the notion that even thought it's only a piece
of metal, it has the potential to be used for transmission. CB (27 MHz)
transceivers are prohibited in Malaysia.

I was able to find the following info on the BC-348Q receiver.

Bands:
1) 200-500KHC
2) 1.5-3.5MHZ
3) 3.5-6MHZ
4) 6-9.5MHZ
5) 9.5-13.5MHZ
6) 13.5-18MHZ

Sensitivity indicated at 3-7uv at antenna input
Audio output = 10mw into 4Kohm load
Single conversion to 915KHZ I.F. (BW not given), CW XTAL filter installed
2 stages of RF and 3 stages I.F.

Tube lineup:
1st and 2nd RF VT-117 6SK7
Mix and osc VT-150 6SA7
1st and 2nd I.F. VT-117 6SK7
3rd I.F. VT-116 6SJ7
2nd det, AVC, BFO VT-233 6SR7
AF out VT-152 6K6

1036. METEOSAT software - DARTCOM

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-12 13:58:32 UTC
From: frode@cernvax.cern.ch
Message-ID: <6129@cernvax.cern.ch>
Source record: 295304
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

Yesterday I saw a demonstration of an astounding piece
of software for receiving and displaying Meteosat images
on the IBM PC. The software is written by Brititsh
Aerospace and is called DARTCOM (v.2.2a). It allows you
to zoom, pan, add colour from different palettes and to
store images to disk. It has a multitude of other options
and one of them allows you to see the height of the clouds
while you display the image. Other possibilities are 3D
images and 16 frame animation. It is the best programme
of this type I have seen so far.
Does anybody have any further information about DARTCOM?
I should like to know if a detailed description has been
published somewhere, and if the software alone is available
commercially. What I saw yesterday was a complete Meteosat
receiving station with DARCOM that is commercially available
for about 10000.- Sfr.

1037. Re: First HF station

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-12 14:05:21 UTC
From: rachiele@NADC.NADC.NAVY.MIL
Message-ID: <9107121405.AA04267@next0.nadc.navy.mil>
Source record: 295307

Ok, I need some help:

1. I am looking to purchase my first HF station....(I
currently
have nothing in this space)

2. I have allocated (my wife disagrees) about $2000.00 for
the

investment.

3. I currently have interest in CW/SSB/RTTY (no packet).

4. The only limitation aside from the $$$$ is no tower or
beam.

What are your suggestions. Rig/Power
Supply/Antenna/Tuner...etc
There are a lot of rigs in your price range, I would suggest you spend a little less, until you are really sure what you want.
Questions to ask yourself:
Does it have to be solid state, or would an older tube/hybrid rig do? You could pick up a Kenwood 530 or 830 for less than $800 if you shop carefully, or if you prefer solid state, it's hard to beat the kenwood 430 or 440. If you prefer American made, the Tentek Omni or one of it's look-alikes is an excellent radio, so is the Drake 7 line.

How much space do you have?
If you have plenty of room you might have some fun with an older boat anchor, like a Yaesu 560DX. (one of these can be had for around $300-400.) If you're operating from an end table in the family room you should be looking at Kenwood 140 or that little Icom radio.

The advantage to buying a used rig is that as long as it is in good operating condition, you can usually sell it later for nearly as much as you paid for it (sometimes more!). This is almost never true of new gear. The down side is that there are often problems with used equipment. It's a good idea to buy them through someone you know and trust, or failing that, bring someone along with you who can give the equipment a long test drive before you buy it.

Wire antennas are good. If you don't have the space, a ground-mounted vertical is also very good, although a good rf ground is essential to their operation. If you have small kids or pets it might be advisable to put a small fence around it.

If you have a well-matched antenna on the band you are operating on, you don't really need a tuner, but don't operate without an SWR meter.

You don't need a keyer for CW operation, I always use a straight key. Even with that, I can never copy as fast as I can send.

If you do decide on a tube rig, make sure you get a dummy load to tune into. With tubies, you need to adjust the radio first, before you start sending on the air. This is not as necessary with solid state.

Is that everything? No, make sure you have a good ground (rf and electrical) in your shack so you don't electrocute yourself. And I'm sure I left out something. Anyway, with careful shopping at the flea markets, you can get on the air for under 1k easily, and maybe for under $500.

Hope that helped.
These are just my private opinions, your mileage may vary.

In an HF radio receiver where you want good adjacent channel selectivity, you care about phase noise 5 to 50 kHz. away from the carrier. For the architecture being discussed, this will be outside the loop. The 1/f noise within a few kHz. of the carrier is of no consequence in an HF receiver. If it were important, the old radios with free running VCO's would not be usable. Hence the phase locked loop has nothing to do with the comparison (assuming it does not *add* noise or spurs outside its loop bandwidth, which can easily happen).

Any scheme that puts a digital divider between the VCO and mixer is immediately limited to a noise floor of -145 to -160 dBc./Hz. due to divider noise. It is quite possible to make a 5 MHz. VCO with -170 to -180 dBc./Hz. noise floor at a few 10's of kHz. away from the carrier. Hence, if you want to build the ultimate HF receiver, you should *not* use a divided down VCO.

Our local OO uses a year-old database. If the local check says the call isn't hi-powered enough, he calls up the database in Gettysburg. I agree that apparent license class violations should be directed to your OO, not to the FCC. The OO has the resources to confirm the violation without pestering the FCC with false alarms.

Recent posts about "illegal" QSOs with people that wander into the ham bands with equipment they don't understand seems a little too legalistic for me. Laws and bureaucracy should never override rational thought. The OO I know is pretty reasonable. If I got a pinkie for redirecting a visitor, I wouldn't mind.

I've noticed a chirp in the sidetone of my TS440. I think it has
something to do with RF feedback, because it isn't on all bands, and
disappears when I use a dummy load. I haven't had anyone tell me that
my signal is chirpy.

I always operate full-QSK, so I don't know if it goes away in semi-QSK.

This is a gripe I have with the ARRL treatment of Smith Charts. I was one of the initiated, so the curt handwaving didn't bother me much. I wondered how the uninitiated figured it out, tho.

>The description in the ARRL Handbook of use in matching a device in

There's a pretty good introduction to Smith Charts in Shaum's Outline Series for Transmission Lines. As Cliff's Notes is to Literature, Schaum's is to EE. I found mine as a student at a university bookstore.

I might also expect a university library to have something that may explain Smith Charts. Usually, there is a transmission lines textbook that will reveal the techniques.

Definitely go for the IC-24 or IC-W2. They have aviation receive. I don't
know about OOB for transmit, but I have heard no complaints about the lack
of such features. The IC-32 does not have aviation though it definitely
does have OOB transmit (138-174 and 400-479 with about 30 MHz of usable
lock range). The IC-32 is out of production and not available as a new
item any more.

I found the description in the RCA Power Devices (??) manual to be quite
good. Wish I had the book here so I could give a better reference.
The book was from the mid-70's, I believe. Might have been called
"Power Circuits Manual"... Anyway, besides the elementary info on
Smith charts and transmission lines, it goes into using a Smith chart
to analyze an arbitrary "ladder" of L's and C's in series and shunt to
ground. It includes a way to estimate Q of a filter from the Smith Chart.
For me, at least, it was clear and concise.

The ARRL has a relatively recent book, Antenna Impedance Matching
(I think...), devoted entirely to Smith Charts and how to use them. Haven't
entirely mastered it, but looks good so far. Struck me as excellent value for
the price. (ca $15?) I got mine at a ham fest. By mail order, the Smith
Chart content would not have been at all obvious, due to the title.

And I respond to my own posting thus:

OK, OK, so I went home & got my facts straight. The HR article is in the November 1970 issue, and is probably the best you're going to find among the ham rags.

Also, I incorrectly referred to the ARRL book (in fact my guess at the title was completely wrong. And I have a copy!): The ARRL UHF/Microwave Experimenter's Manual. Its treatment of Smith Charts is kind of feh, now that I have reviewed it. It's definitely a worthwhile book to own, although it shares the same gappy treatment that all the other ham microwave books have. So sue me.

sigh Wetware is such a lossy storage medium.

WOW! Don't I wish. In 35 years I don't have that much invested
(purchase-sale/trade) and I have 4 HF rigs running on Ham/MARS.
I do suggest that you get a fairly used simple HF transceiver at a
hamfest and use it awhile until you decide what features you
really want and where you want to conecntrate your operating time.

> 3. I currently have interest in CW/SSB/RTTY (no packet).

> 4. The only limitation aside from the $$$$ is no tower or

How about vertical antennas? Make them out of wire (hang top
of wire from tree) or aluminum tubing with GOOD radials. Verticals
and dipoles properly installed require no tuner. If you want a
good tuner, build your own. You'll learn a lot of useful
information in the process. If you have the room, a horizontal
long wire V beam (requires tuner) will put you right in the DX
chase with the big beams.

In article <14570106@hpnmdla.sr.hp.com> alanb@hpnmdla.sr.hp.com Alan Bloom wrote and Al, N1AL, and Jim W2XO responded:

> ....article in QST where
> the guy combined a Colpitts oscillator (which drifts up in frequency)
> with a Hartley oscillator (which drifts down in frequency) to get an
> oscillator with no frequency drift at all. You had to turn off the
> power supply to change the dial setting.

That was indeed an April spoof article which appeared in QST around 1956 when I was just getting seriously into building equipment. The article was written by "Larsen E. Rapp", an obvious pseudonym, and proceeded to describe a VFO which was better than anything ever built. The article started with the premise that a Hartley oscillator chirped upward in frequency when keyed, and was useful for operating near the lower edge of an amateur band. The Colpitts oscillator purportedly chirped downward in frequency when keyed, and was useful for the upper band edges. Larsen E. did the obvious--he combined the features of both oscillators and allegedly came up with a design which canceled chirp {in toto}! ("Gee Toto, I don't think we're in Kansas anymore!"). The article concluded by showing an operating award which the author had won, presumably using this new device to snag DX stations near the band edges.

Subsequent issues were full of letters to the editor both maligning the article and praising it, some insisting that humorous articles had no place in a technical journal. My favorite letter was from an amateur who claimed to have built the new oscillator, and reported that it chirped in BOTH directions!!

Anyone who appreciates tongue-in-cheek humor and has access to a library of old QST's would love reading this masterful piece. I'd appreciate a copy of it from some kindhearted soul--my old QST library went up in smoke in a house fire in the early 60's. Back then our local fire department had the motto "We save the lot!" Ah, but I'm digressing again. Do brains become non-linear with age?

One last item....I don't recall that QST ever revealed Larsen E. Rapp's true identity. A pity.

73 and keep smiling!

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
July 12 to July 21, 1991

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008

Based In-Part from Data Supplied By
The Space Environment Services Center

SOLAR TERRESTRIAL REVIEW FOR 05 JULY TO 11 JULY

Solar activity this week was mostly moderate with a few episodes of high activity. The most significant and geoeffective event this week was a long duration class X1.9/2B tenflare from Region 6703 on 07 July. This event began at 01:19 UT, peaked at 02:23 UT and ended at 02:48 UT. It was located on the central solar meridian at N26E03 and was associated with respectable Type II and IV sweeps. This event produced a significant satellite proton and polar cap absorption event beginning on 07 July and lasting through most of the week. Protons peaked at 2,300 pfu at greater than 10 MeV at 16:45 UT on 8 July. The 100 MeV protons were not enhanced with this event. The copious influx of protons produced a healthy PCA event of about 13 dB near 17:45 UT on 08 July. A major SWF was reported in conjunction with this flare. The other major flare of interest this week also emanated from Region 6703. This event was unusual in that Region 6703 was a spotless plage area prior to the eruption of this large flare. The event began at 09:28 UT, peaked at 10:37 UT with an x-ray class of M7.3, and ended at 11:03 UT. This flare was optically rated a 3B (large and brilliant) which is unusual considering Region 6703 was void of spots at the time. However, magnetic imaging indicated a moderate level of magnetic complexity in this region prior to the flare. This flare was located at N22W51 and was associated with a fairly strong Type II sweep. A Type IV was not observed. Unlike the class X1.9/2B flare which occurred earlier in the week, this class M7.3/3B event contained parallel ribbons and was associated with an eruptive prominence system. It may have been responsible for an enhancement in protons.

Geomagnetic activity this week was characterized by generally active conditions with one day of major storming associated with the class X1.9/2B tenflare of 07 July. The interplanetary shock associated with the X1.9 flare event arrived at the Earth on 08 July at 16:35 UT. The magnetospheric compression from this shockwave was sufficient to cause several geosynchronous satellites to cross the magnetopause. The GOES-6 and GOES-7 spacecraft experienced magnetopause crossings with the arrival of this shock.

GOES-7 was most affected by this activity. Middle latitudes experienced mostly minor to major storming, while higher latitudes witnessed severe geomagnetic storming (see the Geomagnetic Activity Summary Chart below).

A minor to major auroral storm materialized with this activity. Auroral observations over some central middle latitude regions were reported, along with extensive high-levels of auroral activity over the northerly middle and high latitudes. Equatorward migration of the auroral oval occurred with this activity. The southward boundary of the northern hemisphere auroral zone migrated just slightly beyond the Canada/U.S. border on 09 July, prompting extensive auroral observations from the northern U.S. states and all of the Canadian provinces. A few reports of auroral sightings from Australian regions were also received. No reports were received from European areas. The timing of the main phase of the storm provided North American viewers with the best opportunities for observing auroral activity, particularly over the central and western continental sections of North America.

A complete polar latitude HF radio blackout was observed in conjunction with the peak PCA activity. High latitudes also experienced HF blackout periods, but were not affected as severely as the polar regions. The arrival of the shock from the class X1.9/2B flare of 07 July produced a respectable ionospheric storm

HF propagation conditions were strongly degraded over almost all latitudes with this storm. Ionospheric conditions rapidly became very poor over the high and middle latitude regions with the arrival of the main phase of the geomagnetic storm. The planetary A-index of 85 for 09 July illustrates the power of the geomagnetic disturbance. The ionospheric disturbance was also powerful, lowering MUFs considerably, raising LUFs and causing the rest of the available open bands to become very unstable and noisy. Conditions remained very poor to poor over the high and polar latitude regions for several days following this storm. Middle latitudes also failed to recover rapidly. Daytime fading has been quite heavy due to associated minor solar flaring and weaker ionospheric conditions.

VHF backscatter was reported over several high and middle latitude regions. No reports of backscatter were received from the lower latitudes. Conditions were quite favorable for backscatter over many high and middle latitude regions. Conditions have since stabilized and widespread backscatter is no longer possible.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to be mostly moderate for most of this week, becoming low late in the week or early next week as most of the centers of activity begin to rotate beyond the west limb. There is a slight risk for an isolated major solar flare sometime this week from several regions, although most of the flare activity is expected to be in the lower M-class or C-class levels. We will approach the rotational minimum in solar indices and activity this coming week.

A sudden magnetic impulse was observed at 09:23 UT on 12 July, most likely associated with the minor class M3.6/2N flare of 10 July which was associated with fairly major Type II and IV sweeps (as well as a proton enhancement in the near Earth environment). Geomagnetic activity is expected to be generally active to very active (K-indices of 3 to 4) over the next 12 hours. Near or after 06:00 UT on 13 July, a second interplanetary shock may arrive from the class M7.3/3B flare of 11 July. This impact is also expected to produce generally active to very active conditions with a slight risk for minor geomagnetic storming.

Auroral activity is expected to become mostly moderate over the northerly middle and high latitude regions on 12 to 14 July. The most intense periods of activity will be confined to the higher latitudes. The central middle to low latitudes are not expected to witness any activity over the next week (barring future major energetic solar events).

HF propagation conditions will be generally fair to good over the middle and low latitudes, becoming poor over the northerly middle to high latitude regions. Polar regions are still experiencing poor to very poor propagation conditions due residual effects of the recent significant PCA activity. Polar latitudes are not expected to recover significantly until after 14 July (again, barring significant solar activity).

There is a slight risk for isolated periods of VHF backscatter or associated auroral sporadic E over the high latitudes and possibly some northerly middle latitude regions on 12 to 14 July. Otherwise, conditions are not expected to be particularly favorable for VHF DX.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 12 JULY

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6707	S12W75	253	0120	HSX	01	001	ALPHA

NOTES:
The data above represents preliminary planetary geomagnetic activity. Data from many magnetic observatories around the world are used in constructing the above chart. The first graph line for each day represents geomagnetic activity which occurred between 00 UT and 03 UT. The second graph line represents activity which occurred between 03 UT and 06 UT, etc. For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: oler@hg.uleth.ca.

CONFIDENCE LEVEL: 65%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

```

Cumulative 60 day Solar Activity Record
Start Date: May 13, 1991

NOTES:
Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "oler@hg.uleth.ca".

1053. Re: Smith Charts

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-12 23:14:31 UTC
From: Hugh_E._Wells.El_Segundo@xerox.com
Message-ID: <"12-Jul-91.16:14:31.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 295323

There have been a number of books and articles written about Smith Charts and how to use them. Besides the article quote previously from an early Ham Radio magazine, I've found the next best information is from a book published by Howard W. Sams. The book describes the use of the Smith Chart while solving "real" electronic problems such as input and output matching networks for transistors. It is written in down to earth terms and really makes sense to the beginning user of Smith Charts.

Thank you to all Hams who helped me with my IC W2 last week. Because the
the same question starts over again AND me also nothaving been the first
I will herewith supply the possibility to access what I have by archive
mail.

Sorry OM's, I could also allow FTP, but: that costs money for me (Mail
does also, but it can be queued to low cost telephone time and sent with
64 kBit/s ISDN, while news are coming in).

Other modifications will be added, if sent to me.

Now the -short- INDEX

1055. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-13 15:38:36 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9107131538.AA09738@blackbird.afit.af.mil>
Source record: 295230

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

1056. MAJOR GEOMAGNETIC STORM ALERT - 13 JULY

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-13 16:48:20 UTC
From: oler@HG.ULeth.CA
Message-ID: <910713104820.204000e3@HG.ULeth.CA>
Source record: 295231

/\

MAJOR GEOMAGNETIC STORM ALERT

ISSUED: 15:00 UT, 13 JULY

/\

ATTENTION:

A major geomagnetic storm with severe periods of storm activity materialized at 15:00 UT on 13 July. Conditions have been at minor to severe storm levels since approximately 09:00 UT on 13 July. The impact from the last major flare was apparently much larger than expected.

A major auroral storm materialized after 09:00 UT on 13 July and remains in progress at the present time. A Low Latitude Auroral Activity Watch has been issued for the local evening and early morning hours of 13/14 July. Conditions may be favorable for lower latitude observations, although by the time evening twilight ends for North American observers, the activity should be on the decline. Nevertheless, there remains a risk for lower latitude auroral observations, particularly over the European sites.

A major ionospheric storm is expected with this activity. High latitude blackout conditions may exist quite frequently. Middle latitude blackout periods are also possible, but less likely to occur. Middle latitudes should witness primarily poor to very poor propagation conditions on HF bands. Lower latitudes will also experience degraded conditions over the next 24 hours.

There is a significant possibility for VHF backscatter over the next six hours. The probability will decrease thereafter. Pay attention to the K-indices broadcast by radio stations WWV and WWVH. Indices of 6 or higher indicate possibly favorable backscatter conditions over the middle and possibly lower latitudes.

This activity is expected to continue over the next 6 hours, possibly extending for another 12 to 18 hours (it is very difficult to say). The intensity of this activity was not expected to be so energetic. Again, this shows how unpredictable some events can be.

For the most recent storm updates and information, our computer BBS is available 24 hours a day. The phone number is: (403) 756-3008.

** End of Alert **

As far as I know, STM recognises those issued by all Commonwealth
countries... not too sure about other countries though.

1058. LOW LATITUDE AURORAL ACTIVITY WATCH - 13 JULY

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-13 17:19:26 UTC
From: oler@HG.ULeth.CA
Message-ID: <9107131119 26.2040019c@HG.ULeth.CA>
Source record: 295234

/\

LOW LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 16:30 UT, 13 JULY

/\

ATTENTION:

Major to severe geomagnetic storming has materialized. The impact from
the last major flare appears to have been much stronger than previously
anticipated.

Significant auroral storming is expected over the next several hours.
There is a slight chance for isolated lower-latitude auroral activity for the
local evening and early morning hours of 13/14 July. Although by this time
the peak of activity should have passed, there remains a chance for lower
latitude observations.

Please send any reports of auroral observations to: oler@hg.uleth.ca.

** End of Watch **

1059. RTTY DX Notes for week ending 12th July 1991

SB RTTYDX @ ALLBBS $KT7H193
RTTY DX Notes 1of3 7/12/91
RTTY DX Notes for week ending 12th July 1991
BID: KT7H193
Part 1 of 3.

Being one of the very early users of the AMTOR system, back in the
late 70's early 80's, and having to learn all about the system, I
never cease to be amazed by some of the present day operators who do
not appear to have bothered to read up on the protocol and parameters
of the system before using it. One hears talk of 'check sums' (what
ever they are) and repeats of the sent block to see if it is correct.
They must have read different information to what I did. What ever
happened to control 1, control 2 and control 3? And where did alpha
and beta go to? And what do error and RQR really mean? Also, what is
the delay for? I thought it was transmit delay. Maybe I was wrong,
maybe you set the delay to give you time to think what you are going
to say, or maybe it is for the receiver to test the strength of the
incoming signal? I guess that I will go back and read my books again.
Join me and maybe we will both learn something.

Our thanks this week go to I5FLN, K4FJ, OD5NG, OZ7GI, QRZ DX
Newsletter, TG9VT, VK2EG and W2FG and the Tri-State Packet Cluster DX
Network. Thank you all for your assistance with these notes. Without
your help there would be no information to impart.

QSL INFORMATION:

EK9QRP/9 collects his cards from Box 146, Sverdlovsk, 620131 USSR.

Continued in part 3.
/EX
SB RTTYDX @ ALLBBS $KT7H195
RTTY DX Notes 3of3 7/12/91
RTTY DX Notes for week ending 12th July 1991
BID: KT7H195
Part 3 of 3.

ZC4KS says to send his cards to the ZC4 bureau, or to BFPO 53, London, England.

UF6FJ has Box 120, Tbilisi Z.C. 380008, Rep Of Georgia, USSR as his QSL address.

Notes of Interest:

QRZ DX Newsletter states that Nevis Island (V47DX) will be activated on all modes July 16th to 23rd by N5FTR, WD5DQR and KA5BQA. QSL via N5FTR.

TY5PS goes on vacation from 17th July until mid August.

9X5LJ goes on vacation from 27th July until 4th September.

The cancelled trip of last year to the South Sandwich Islands is going to be attempted again this year with a cheaper ship. They anticipate arriving on Thule Island in early December. RTTY will be used and QSL via KA6V. If you have some spare cash you can send it along to him also. More later. It is hoped that they will make it.

Regarding cards for 5N0ETP, I did ask for information for the correct QSL path. I do not wish to confuse people, but i received the following information. TG9VT says that he received a quick reply from N6QLQ, while OZ7GI (who received his card via the bureau) says that the following QSL address are listed on the card.

Keith R. Appleton, Keith R. Appleton, USSR Manager
Chevron Overseas, or Chevron U.K. or UA9QCQ
PO Box 5046, RM43325 Nigeria Pouch Oleg Vdovin
San Ramon 2 Portman St P.O. Box 83
California 94583 London W1H 0AN Shadrinsk
U.S.A. U.K. U.S.S.R.

OZ7GI also suggests that you send the card via the bureau to N6QLQ.

GL DE DX1 (VK2SG).

Digital dividers change state every 40th clock period (or whatever N is).
They do not extract any information from the intervening clock periods and
hence there is no averaging effect such as you stated. I suppose in principle
you could build 40 digital dividers operating 9 degrees of phase apart so
that every input clock transition would be acted upon by one of the
dividers. Then if you averaged the outputs of all these dividers, you
might get some averaging effect. However, that is not the architecture
we are talking about here.

1061. LOW LATITUDE AURORAL ACTIVITY WARNING - 19:30 UT, 13 JULY

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-13 20:00:57 UTC
From: oler@HG.ULeth.CA
Message-ID: <910713140057.2040023c@HG.ULeth.CA>
Source record: 295235

/\

LOW LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 19:30 UT, 13 JULY

/\

ATTENTION:

A major to severe geomagnetic storm is in progress. Significant auroral storming is also in progress and is expected to continue for the next 12 to 18 hours. Conditions are favorable for lower latitude auroral observations. Australian reports indicate extensive auroral activity. There is some question as to whether the activity will endure long enough to be observed over North America during the local evening and early morning hours of 13/14 July.

If storming continues at the present intensity, extensive auroral observations may be possible over North America from the central middle latitudes to the high latitudes. Activity might also be observed from some lower latitude regions during particularly intense substorm periods. This warning will remain in effect until 15:00 UT on 14 July. It will then be updated or cancelled. If conditions change rapidly during the period, an intermediate update may also be posted.

This is a global warning to the potential for low latitude auroral activity. Activity will be closely monitored. For updated information, consult the Solar Terrestrial Dispatch computer BBS, available at: (403) 756-3008, 24-hours a day.

** End of Watch **

1062. Looking for Ham club at Lackland AFB, San Antonio, Tx.

What's this about a 2m to 70cm converter? I could really go for one of those!!! Who makes it and how much does it cost? Also, who sells it?
Is this device suited for an HT (small box that sits on the BNC) or is it for a mobile/base rig?
Thanks much,
Mike Gordon N9LOI

From: edg@netcom.COM
Message-ID: <1991Jul14.063946.669@netcom.COM>
Source record: 295242

There is a basic treatment of the Smith Chart in the Extra Class License Manual.

I have mailed a copy of the appropriate pages to the original poster, since he's in Canada, and probably doesn't have access to License Manuals for the USA.

Hopefully, that and other resources described here will get him going.

1065. MAJOR GEOMAGNETIC STORM UPDATE - 14 JULY

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-14 07:14:44 UTC
From: oler@HG.ULeth.CA
Message-ID: <910714011444.20400304@HG.ULeth.CA>
Source record: 295241

/\

GEOMAGNETIC STORM UPDATE

MAJOR STORM UPDATE

/\

07:00 UT, 14 July

STORM UPDATE INFORMATION:

Geomagnetic activity is beginning to stabilize. Notable stabilization has occurred over the last six hours, although periods of intense major to severe storm level perturbations have occurred, particularly over the northerly middle and high latitude regions.

Major geomagnetic storming will continue for approximately the next six hours. Thereafter, conditions should become generally active to minor storm. This major geomagnetic storm may not officially end until sometime on 15 July.

Auroral activity is also stabilizing. The Low Latitude Auroral Activity Warning has been downgraded to a Watch as of 06:00 UT on 14 July. Conditions are becoming increasingly unfavorable for lower latitude auroral observations as activity wanes.

The ionospheric storm which materialized will keep HF propagation conditions at very poor to fair levels over the next 24 hours. Low and middle latitudes will be the first regions to witness improvements in propagation conditions. Some improvements may be observed throughout the remainder of this UT day (14 July) with more significant improvements occurring on 15 July. High latitude regions should continue to suffer very poor to poor propagation conditions on 14 and most of 15 July, with more substantial improvements occurring late on 15 July and on 16 July.

An update will be posted later this UT day. For intermediate information, all regularly updated alerts and forecasts may be obtained from the STD BBS at (403) 756-3008. Indices and other forecasts may also be obtained by registered users.

Please report any sightings of auroral activity or significantly degraded radio propagation conditions to: oler@hg.uleth.ca (Internet) or leave your observational messages to the "Sysop" for disemination and analysis on the STD BBS. We appreciate all those who make an effort to report observed activity.

/\

GEOMAGNETIC STORM UPDATE

MAJOR STORM UPDATE

/\

18:00 UT, 14 July

STORM UPDATE INFORMATION:

Geomagnetic activity has stabilized further. A few periods of severe geomagnetic storming were observed over the northerly middle and high latitude regions between 03:00 UT and 12:00 UT on 14 July. Conditions since 12:00 UT have been considerably more stable.

Likewise, auroral activity has diminished in tandem with geomagnetic activity. The auroral storm has almost ended. The Low Latitude Auroral Activity Watch has been cancelled. Lower latitude auroral activity is no longer possible. The locations best suited to observing the activity were Australia and parts of Europe. The best period of time was on 13 July. The timing of this storm was not sufficient to produce particularly good observing conditions for North America.

HF propagation conditions are gradually improving over all regions. High latitude regions will be the last areas to notice improvements. More significant improvements will take place on 15 July.

VHF propagation conditions are near normal over the middle and low latitude regions. High latitudes may still be experiencing abnormal conditions. A return to more normal conditions over the higher latitudes will take place on 15 July.

A summary of this storm event will be included in this weeks STFR report.

I like to add that to qualify for such a license, one has to take 2 tests,
electronics & ham radio and morse code.

Does anyone know if this kind of computer-based "robot" QSO simulator
exists as e.g. software for a PC?

1072. FT470 Xtended UHF receive Mods

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-15 12:24:41 UTC
From: brian@towers.uucp
Message-ID: <1991Jul15.122441.1623@towers.uucp>
Source record: 295259

This mod is from Darrel Sego (KM9S) and it will allow your 470 to receive up to 500 Mhz without affecting the xmit of the unit on 440.

Mod follows:

YAESU FT-470 UHF RECEIVE MOD.

This modification will make the popular Yaesu FT-470 dual band ht receive above 450 mhz. Basically, this procedure stores the upper limit into the U memory. To use it tune to the U memory channel press the (MR) hey to go to the MR mode then tune down to the desired frequency. Once the correct frequency obtained, you can place it in any memory but remember to keep the U memory channel active with the highest frequency you would want, (I keep mine at 470 mhz).

Here are the steps in proper order.

1. Program the frequency of 450.00 mhz simplex.

2. Press the FUNCTION and then the RPT button for the offset.

3. Enter the code 0000 into the keypad.

4. Shut the transceiver off and turn back on.

5. Press the RPT key twice for a + (plus) offset.

6. Press the REV button one time.

7. The radio should now display 1450 mhz.(The radio will not operate at these frequencies. My service monitor shows that above 500 mhz the rx is very weak.)

8. To get to the proper frequency to store in the U memory channel press F and then hold the down arrow key to drop in frequency one mhz at a time. Stop for now at 500 mhz.

9. To store this frequency in memory press the F key and hold until you hear two beeps. At this time rotate the dial knob until the channel U is displayed. Press the F key again, you should hear a beep. this indicates that this upper channel is stored in the U memory channel.

10. To use the higher frequencies you have to go to the U channel and press the MR button, this puts you in the MT (memory tune) mode. from there you can scan down or use the dial knob to go to a lower frequency.

11. ANY selected frequency can be stored in a memory channel.

12. That's it!

NOTE. Some radios will not let you go up in frequency only down. If
you try to go up the rig will default back into the original ham band.
for some reason mine will let me go up or down.
GOOD LUCK
Darrell Sego KM9S

I ordered mine thru the technical support number; the person was
helpful... she said that they didn't have them in yet and was not expecting
them in for 6-12 months! She did take my credit card number and said that
they would mail it out as soon as they were in print...

She also mentioned that the manual for the ICOM 24AT was not available until
12 months after the radio was introduced.

The bottom line is don't hold your breath waiting for the service manual.

The problem here is that rec.radio.shortwave also receives Sun spot condition reports etc.... I think a decision has to be made regarding where the focus of the announcements lie : General Radio or Amateur specifically. This decision should aid in making the group heirarchy more understandable. Either way, I'm in favour of the group.

I think that a lot of people did not participate because of the poor conditions. I am certain that most of the scores will be much lower than usual. Any one else on the net that went through this torture?

For a little while, about 3 hours total. I only have antennae up for 20 and above right now, so I wasn't trying to be competitive, but I thought I could pick up some new DX.

I started about 1700Z on 20 SSB, and only Ws to be found (only zones 7 & 8, in fact). I hopped up to 15 SSB, where I bagged VP5 and an EA8, but that's it...in about 1.5 hours of SSB, only those two DX and 4 zones in 50+ contacts.

I went to 20 CW about 0200Z for 1.5 hours, and it was better, but not much. I didn't hear any europe at all, but like you said, the north-south paths were ok. The DX was XE, P4, V2, VP2, C6, KP2, LU, PY, CE, ZF...that's it for me, and I worked about everything I could hear. I didn't get back on Sunday morning at all. I haven't tallied my point total, but only about 90 contacts, sigh.

The timing of the storm was terrible, because by Sunday afternoon, there was plenty of Europe on 20 here, and I worked ZL and VK last night.

2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.178 DATE: July 15, 1991
SUBJECT: Why volunteers may refused

In your briefings for potential volunteers, several local government officials have brought up the following points on why the services of volunteers may be refused. It is only fair that potential volunteers understand the following items, if applicable, in advance:
1. A designated government department, agency, or organization is usually the primary response and responsible agency. Volunteers, therefore, must be either members of that government organization or have an agreement with that agency.
2. Volunteers offering to help during or after the incident are usually too late. Governments who use volunteers prefer to orient and train them in advance. The volunteers then know in advance where to go and what to do.
Those are the two most common inputs we receive from government agencies. We are not talking about the one time volunteer, of course, but those who participate in frequent incidents and other activities of their government. We urge any volunteer to associate yourself with that government agency or organization that has an OFFICIAL response responsibility.

>Perry / AA0ET

Yes, indeed, me too! Somehow I resent the idea of adding my IC-12GAT to the load of gadgets I usually carry everywhere. The '24ET (or the W2E i am told to receive this week) is small enough not to be a nuisance even in the summer-time when I seldom have an overcoat or even a jacket with me, but the 23 cm repeater is near to be true here...

Has anyone heard rumors of a portable tribander? If a duobander can be built in the size of a 'W2 three bands in a radio as big as the IC32 wouldn't be a surprise.

Source record: 295253

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 019 (OPDX.019)
July 15, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, QRZ DX, DL6RAI, WB3LHD, WK3N, NA8A, KQ8M and K8MFO for the following DX information.

3B7, AGALEGA & ST. BRANDON. 3B8CF stated he will not be going to 3B7 for another 2 months. No dates have been set and everything depends on the availibilty of ships. There were reports of 3B7CF on the air this week, but they were all slim operations.

3D2, ROTUMA. Antoine, 3D2AG, was active from Rotuma Island between July 3 thru the 10th. QSL to his CallBook address.

4K, SNAKE ISLAND. 4K5ZI became active, July 11th, on 14188 kHz around 0430Z and was going by call areas. The group of Soviets was to start their operations July 6th and end on July 26th.

5U7, NIGER. Alan, 5U7NU, has been active again on 14248 kHz at 2300z. He was heard saying that this will be his last week at 5U7. Alan's job as a airplane pilot will take him to "TZ" in a few weeks. A new callsign has not be issued to him yet but he will be active from the new QTH.

EA8, CANARY ISLANDS. Well known DXer Matti, OH2BH, is signing OH2BH/EA8 and it is not known how long he will be operating from EA8. Check the follow frequencies: 14250, 14266 and 21235 kHz. Most activity seems to be around 2230 to 0400z.

FO, FRENCH POLYNESIA. Look for Daniel, FO4DL in the early morning hours around 0700z on 14249 kHz.

QSL CARDS IN THE MAIL. HK0TU (8 Months), T31KY (4 Weeks), D44BC (6 Weeks) and YA0RR.

V4, NEVIS ISLAND. Be looking for a V47DX to be active this week. The operation will start July 16th and last until July 23rd. No special frequencies have been mentioned, but activity will be 10-160 meters on SSB. There may be some RTTY and AMTOR activity. QSL via N5FTR.

VP8 SOUTH SANDWICH ISLAND. QRZ DX reports the DXpedition to South Sandwich has been delayed until March. The reason is the ice will be

in better shape for landing.

YA, AFGHANISTAN. As of Sunday, July 14th, nothing has been heard of the Italian group who was to begin their YA operation July 12th. Let's hope nothing has gone wrong. KYFC!!

ZA, ALBANIA. (The Story Behind The Rumor!) Ben, DL6RAI, informs the OPDX Bulletin of the truth about: "the possible operation by I3BZK and I3GJZ to ZA-land to start July 11." This information was originally posted on packet radio somewhere in Italy. The original message even included a telephone number for stations who wanted to be put on the list. We DXers hope for a ZA Dxpedition so badly this information was published in almost every DX bulletin. While this info was being passed around from bulletin to bulletin, a second packet message was sent. This time it was from the "real" I3BZK stating that somebody was trying to fool him and was passing bogus information. Obviously everyone has read the first message but not the second one. "BUT WAIT!!!!", says Ben. In fact, Ben heard that a large group of Italians will operate from Albania during mid-July. Marius, YO3CD, a good friend of Ben's, received this info a couple of days ago in Italy before visiting Germany. Now the question: Is this the old story or is there something really going on? According to Marius's information, there are about a dozen operators involved in this Dxpedition. I guess all you can do now is stay tuned and ready. KYFC!!!

ZK1, SOUTH COOK ISLAND. ZK1CQ has been active on CW on 21026 kHz around 0300z, 7003 kHz around 1000z to 1130z, 14026 kHz around 0730z and on 18071 kHz around 0400z. Check the 15 meter band for his strong signal into the states, even if the band sounds poor. Dale, NA8A, said, "When last heard he was the only signal in 8-land heard coming through when the 15 meter band was completely dead."

DXCC BACKLOG. Things are looking better now then 6 months ago for the DXCC Desk. It has been reported this week the DXCC endorsement backlog is down to 3 months instead of 6 months in the beginning of the year.

THE WK3N WORLD DX NEWS REPORT.....
Ljubljana, Yugoslavia-- A European created plan to avoid civil war in that country received a major boost when Slovenia's parliament voted overwhelmingly to suspend its independence drive. But the violent war continues in a different area of the patchwork nation! This time near the Yugoslavian and Albanian border. Reason unknown at this time..... The BBC reports that "Civil problems are now brewing in Sierra Leone... .... World Monitor News says that both government and guerrilla troops have once again clashed in heavy fighting in El Salvador..... Amateurs may wish to listen or check into the ANARC SWL Net, Sundays, on 7140 kHz at 10 AM EST for times and frquencies of shortwave broadcasters in these areas.....

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the

Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send
BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message
via packet to KB8NW @ WA8BXN.OH.USA.NA

I know this matter has appeared in the netnews recently, but I couldn't find it now.

I am a Singaporean, and would like to travel to Europe, and need to get the travelling document, such as visa, exit permit(??), done. Furthermore, my passport is to be expired at the end of this month. Could some kind soul please tell me where I can get all these things done in the NorthEast of US? I will be glad if you could also provide me with their phone numbers.

Please send email directly to me at khoo@cs.yale.edu.

Thank you very much,

-- Siau Cheng

> ...
>Conditions will probably be stable for the IARU contest this
>weekend, with average A and K indices...
>...

Wrongo...sort of like trying to predict the weather or the winning lottery numbers.

The contest starts at 1200Z (Saturday A.M. - sunrise here in the mountains). No activity on 160 or 80. A few stations on 40 CW, but most of the signals have severe auroral flutter. One UA0, a few JAs, a VK...that is it. After a half-hour I go to 20 - it is worse. No JAs (usually they are rolling in with big signals). A few weak signals on the band, but FO814AA has a good signal on CW. KR0Y tells me that the K index is 7! The transequatorial path is good, but as usual, nobody's home. My vote for the best signal of the morning goes to JL1ZCG on 40 CW - a solid 20 over S9. Head and shoulders above any other JA on 40. Must have a big beam.

I have to leave for a few hours, and when I come back around 1830Z, 20 Meters is almost completely dead. I count the signals that I can copy on the fingers of one hand. A later check of WWV reveals an A index of 76 and a K index of 5 - a major storm in progress. I get on 20 SSB and plug away - sporadic E opening to California. Many W6s calling me saying that I am the *ONLY* station that they are hearing on the entire band - many of them think I am a local station (the K6 call sure fakes 'em out - I do not usually sign /7). I keep checking 15 and 10 - no signals at all. 20 still good - keep plugging away. Finally 20 starts opening up again. Try to work R6L but he can not hear me. Finally work OH6EI - he is very weak but I guess he has good ears. He will be my only European contact in the contest. Later on, EA8AD goes in the log. My only African QSO. Not much DX - PY, LU, HI, C6, VP, ZL - slim pickin's. Only two QSOs on 28 MHz (a local), 5 QSOs on 15, 6 on 160, 48 on 80, 139 on 40 and 342 on 20. Only 12 zones on 20! W1AW calls me on 80 CW, my only IARU HQ QSO. Final score: 542 QSOs, 36 zones, 46,728 total points in 13 hours. I think that a lot of people did not participate because of the poor conditions. I am certain that most of the scores will be much lower than usual. Any one else on the net that went through this torture?

1084. help on HW24 mic gain

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-15 15:54:41 UTC
From: kfeeney@helios.TN.CORNELL.EDU
Message-ID: <9107151554.AA15261@helios.TN.CORNELL.EDU>
Source record: 295256

Help! I have a heathkit HW24 dual band mobile tranceiver (10 watt version) and the microphone gain is way too high. I get continuous complaints about the wind and mobile noise, and on some repeaters I can't even be copied through the background roar. (simplex tests confirmed that it's just the background noise and not some radio problem like a synthesizer rumble) I popped the top and bottom covers to look for a gain and deviation pot to set things down to a reasonable level, but there are a lot of pots in there and none of them are obviously labelled. I found about 10 pots on each side of the radio, and it sort of looks like they are fairly symmetrical copies of each other, one for UHF and one for VHF. I also found two pots over on the side of the radio but couldn't find any way to unmask them and see what they are. What I need is some guidance as to which pots to twiddle to cut down the mic gain. (I think the deviation could stay where it is-assuming they are separate adjustments) I guess most of the parts are labelled with VR numbers, so if someone could give me those designators and a rough idea of where on the board they are I could find them. (I hope) I was wondering if those two pots down by themselves on the side are the two I am looking for, since if I were designing the thing I would make the tranmit audio in common. If so, how to I get to them? I couldn't find a way to get the side rail out of the way.

So, can anyone help me with this? Or do I wrap the microphone in a sock? (and I am also curious what all those other pots are for. I have never seen so many in a radio, lots of trim caps yes, but nver so many potentiometers.)

Thanks in advance....

1085. TS940 CHIRP

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-15 16:00:08 UTC
From: waltk@pica.army.mil
Message-ID: <9107151200.aa17059@CC1.PICA.ARMY.MIL>
Source record: 295258

There have been a fair number of responses on the TS940 CHIRP
problem. Thanx to all who have sent mail. I feel some of those
experiences are worth sharing:

Jim Michener K9JM @ WA6NWE.CA writes:
>
> The TS 940 does that, basically the VCO skews between RX and TX
>and while trying to reduce phase noise they gave the 940 a chirp.
>Kenwood claims there is no problem, but they all do it.
>A friend of mine had Kenwood refund his money and bought an
>Icom 781. I own one, and it does it too....
>There were some phase noise mods done, and they are slightly
>better now (w.r.t. chirp) than they were 3 years ago, I
>have those modification notices at home if you want em
>
Paul, WA3TLD writes:
>Tell me how you have the 940 controls set up and I'll try it on my
>940 to see if I also get the same chirp.
>
and Perry, AA0ET writes:
>
>I've noticed a chirp in the sidetone of my TS440. I think it has
>something to do with RF feedback, because it isn't on all bands, and
>disappears when I use a dummy load. I haven't had anyone tell me that
>my signal is chirpy.
>
>I always operate full-QSK, so I don't know if it goes away in semi-QSK.

Well simply operate the rig on CW in Full-Breakin, or QSK for short. This
implies that the VOX, FULL and optionally the MON, switches are pushed in,
or engaged. Whats interesting is that if the band is open and you use
a directional antenna, such as a beam, and you point it in the direction
where there is good propogation, you will often hear your own signal being
echoed back to you by backscatter. When this occurs you can actually hear
the chirp when the rig quickly (thats relative) goes into receive from
transmit. As a matter of fact, I use this technique to judge how well the
band is open in a particular direction.

On long haul DX there is enough phase distortion due to the _rolling_ effect
of the signal after every earth/ionosphere hop, that the chirp may not be
as objectional. This is partially borne out by the fact that I get very few
reports about signal chirp (in QSK mode) from DX stations. Unfortunately,
stateside hams hear it and it is truly embarrassing. Consider that virtually
all of the tube and/or hybrid equipment from the 60's & 70's have cleaner
signals than the "modern" TS940. Now, if I could only get it to chirp downward

at the same time it chirps upward... :^)
73,
Walt - K2WK.

1086. Re: My first HF station

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-15 16:32:20 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <39910086@hpfcdc.HP.COM>
Source record: 295275

One nice feature of the old hybrids (tube finals) is that they'll load up slightly nonresonant antennae. The drawback is that they require work to change bands. My first HF rig was a Kenwood 520 - solid state, except for driver tube (12BY7A I think) and a pair of sweep tubes for finals. The 520 has a built-in power supply. Cost: $300 used. I bought an Astatic D104 mic for $70. Straight keys are $45 new.

My first antenna was the Butternut HF6VX, mostly because of covenant restrictions. It needs a good groundplane. Cost: $120 new. A multi-wire dipole works, too.

Later, I bought an MFJ 949 tuner and put up a 40 meter fullwave loop. Cost: $120 for tuner, $10 for the loop and feedline.

Perry Scott / AA0ET

1087. R1 (and IC-nSAT) Owners Note...

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-15 18:24:43 UTC
From: paulf@umunhum.Stanford.EDU
Message-ID: <1991Jul15.182443.13765@neon.Stanford.EDU>
Source record: 295261

R1 Tech Note #1 (c) 1991 Paul Flaherty

The BNC connector on most HTs leaves something to be desired, and the R1 and cousins are no exception. The connector nut and the back case form a smooth - smooth metal boundary, and the connector eventually will come loose.

If this happens to you, do *not* merely retighten the nut. Instead, take it off, place a lock washer underneath the nut, and *then* retighten. If you don't, you'll wind up with a cycle of loosening and retightening. This is not a good thing, since the wire connecting the BNC to the PC motherboard is solid, and the solder connection leaves something to be desired.

If you've already managed to twist the wire loose from the PC board, all is not lost; the wire may be reattached. WARNING: The following instructions are *NOT* for the faint of heart. If you have *ANY* doubts about your technical abilities (especially soldering), find someone experienced with repair of handheld radios to do it for you.

You'll need:

A low wattage soldering iron, preferably cordless
The soldersucker of your choice
A very small phillips screwdriver (the smallest standard Craftsman will do)
Some fresh eutectic solder, thin variety
An anti - static wrist strap
Mouse clips or a small pair of needle nose pliers

0. Strap yourself in. Doubtless, the R1 can be zapped by static.

1. Take out the two long screws on the upper right of the back case, the small screw in the upper right of the front case, near the tether hole, and the two screws in the bottom of the front case.

2. Separate the front case from the rest of the radio. There is a printed circuit ribbon connecting the front case to the motherboard, and the ribbon is located on the right (viewed from the front) side.

3. Remove the four phillips screws which hold the motherboard to the back.

4. Now, a few notes on how the R1 is put together. The gray plastic plate, on which the three controls on top of the R1 (squelch, volume, tune) are mounted, slides free from the back case. The gray plastic plate, the controls, the power and speaker jacks, and the motherboard all remove as one piece (thank the Great Engineer).

5. Remove the 300 maH battery by pulling toward you (it's held in place by a metal clip) (and note that it's nicely connectorized for replacement somewhere down the road). Now, pull on the lower (eg, the part that was

nearest the battery) portion of the motherboard, while pushing the power and speaker jacks thru the holes, and then lift up on the gray plastic top piece. The whole mess will come free. Take note of the small piece of rubber which fits between the motherboard and the back case. This forms the shock mount for the board. Also note the small piece of gray rubber which forms the light/lock pushbutton.

6. Take a breather, or have the nurse sponge down your forehead.

7. Remove the BNC connector. Curse loundly.

8. Remove the solder and wire from the PC board hole (in the corner of the board).

9. Reattach the BNC connector to the PC board.

10. Now for the fun part. Insert the BNC connector into the hole, while pushing the motherboard back into position, taking note to reinsert the gray pushbutton piece on the right side of the case (as viewed from the front). Refit the gray top piece. Place the small rubber shock mount behind the pc board, and reinstall the four screws (I used a pair of surgical mouse clips for this, but a pair of needle nosed pliers will do).

11. Reinsert the battery, replace the front cover, and reinstall screws.

12. Turn on. If you've done everything right, you'll have a working R1. If not, make sure you havn't pinched any wires in between the case halves.

One final note. The antenna that comes with the R1 leaves a lot to be desired. Try using a Radio Shack PRO-34 scanner antenna instead; the improvement is impressive.

The standard technique on these old WW-II receivers is to lower the value of the cathode resistors on the RF/IF stages to goose up the gain.

I have a Yaesu FT-470. I use the radio in my car with a 12 volt
regulated supply (home-built). I have a dual band, roof mounted, antenna.
Normally everything works fine and cool. I also have a 30 watt, 2m Amp.

When I use 440 band, I leave the 2m Amp off. Recently, I discovered that
after a long QSO, the back of the radio got real hot. I know that this
is caused by antenna mis-match. My question is.....

Does the FT-470 have thermal shutdown circuitry?
Or
How hot does the radio have to get before smoke or shutdown?

It probably isn't actually antenna mismatch. The FT-470 gets real hot
after using 5 watts out for an extended period even if you do
have a good match. (Mine certainly does) It shouldn't hurt the radio
unless it gets too hot to hold.

Let me add my voice to the chorus also! As long as we are dreaming,
what I would like is something on the order or the TS-440 (or its Icom
or Yaesu equivalent), but with all mode transmit capability on the 50, 144,
220, 420, 900 and 1270 MHZ bands. It should also match the TS-440 in
style and accessories. Oh yeah, while we are at it, receive coverage
should be continuous from 30-1300 MHZ. ;-)

1103. WARC-87 Ship Telex Frequency Changes (effective 7/1/91)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-17 20:26:54 UTC

The following broadcast FEC message was copied on 8534 kHz. at 1400 UTC,
July 17, 1991:

DE WLO

DE WLO
FEC INFO JULY 1 1991

DE WLO

JULY 1 1991
NOTE 1:
IN 1987 THE WORLD ADMINISTRATIVE RADIO CONFERENCE (WARC-87)
FINALIZED A FREQUENCY RE-ALIGNMENT PLAN FOR THE MARITIME RADIO
SERVICE, AFFECTING SHIP AND COAST STATIONS, WORLD-WIDE.

ADDITIONAL RADIO CHANNELS WERE GAINED WITHIN THE CONFINES OF THE
FREQUENCY BLOCK ALLOCATED FOR THE MARITIME RADIO SERVICES. BY
SLICING THE BANDWIDTH OF SSB CHANNELS FROM 3.1 TO 3.0 KHZ, MORE
ASSIGNMENTS CAN BE FITTED INTO THE SAME SPACE. SOME MORSE SPECTRUM
WAS TAKEN AND GIVEN TO SSB AND TO RADIO TELEX.

IN ORDER TO IMPLEMENT THE ADDITIONAL RADIO CHANNELS, A TOTAL RE-
ALLOCATION OF ALL CHANNELS IS NEEDED BECAUSE THIS IS LIKE ADDING
ROOMS WITHOUT ENLARGING THE HOUSE. ALL THE CHANNELS, NEW AND OLD,
RESIDE WITHIN THE SAME BANDS OF FREQUENCIES.

IN ORDER TO AVOID CONFUSION, HARMFUL INTERFERENCE TO OTHERS, AND
INTERRUPTION TO COMMUNICATIONS IN GENERAL, THE WHOLE WORLD WILL
MAKE THE CHANGE AT A PRE-ARRANGED COORDINATED TIME.

0001 UTC, JULY 1, 1991

THESE CHANGES MOVE YOU TO A NEW PLACE IN THE RADIO SPECTRUM. WHILE
YOU RETAIN YOUR RADIO CHANNEL NUMBER, FREQUENCY ASSIGNED TO THE
NUMBER ARE NEW AND DIFFERENT.

THERE IS NO CARRY OVER PERIOD. UNDERSTANDING AND COOPERATION IS
NEEDED. FAILURE TO CHANGE WILL CAUSE SPLATTER,
AND INTERFERENCE TO OTHERS, AS WELL AS TO YOURSELF.

MOST RADIO EQUIPMENT IS EASILY MODIFIED. CHECK WITH YOUR OWNERS,
AGENTS, OR RADIO SERVICE COMPANY.

GOOD LUCK

SERVICE: CONTINUOUS 24 HOURS PER DAY
HH+35 : FEC AUTOMATIC TFC LIST/WEATHER TIME SLOT BROADCASTS (TSB)

NOTE:

I do not know for sure but my guess it that STM is not ready to deal
with the many problems associated with the CB transceiver. By that, I
mean the problem of radio interference (RI), the tracking down and STM's
lack of technology to trace irresponsible and nuisance CB operators,
etc.

Also, laws in Malaysia pertaining to the use of transceivers, other than
HAM, will have to undergo rigorous modifications.

As it stands, a person can be detained under the ISA for use of an
illegal transmitter -- and that includes a toy walkie-talkie!

I'll go one better:

FREE:
Model 15 KSR teletype, with ribbon reinker (RARE), set up for 60wpm
Model 14 TD (tape reader) with spare set of brushes
Model 14 typing reperf (tape punch)
Model 28 RO less case
Model 2B tape printer

If I can find it, a box of paper tape.

This equipment was removed from active service with Southern Pacific
railway about 1970 and has been used for less than 100 hours since.

1107. Vertical Antennas

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-18 11:06:00 UTC
From: SEELER@upei.CA
Message-ID: <43A13BB18E7F00AFA1@UPEI.CA>
Source record: 295188

I am in a position where I believe that a vertical antenna would best meet my needs (space related). I am interested in a vertical which would operate from 80m - 10m. It has been suggested to me that I would be best off if I chose either a Cushcraft or Butternut vertical. I would point out that here on Prince Edward Island we do have fairly high winds during the year.
Comments or suggestions on vertical antennas from these or other manufacturers would be greatly appreciated.

From where I sit, it looks as though the ARRL VEC is significantly
slower than W5YI. After all, my license took only 45 days to arrive,
and that included a 3-day delay from the VE Team to 'YI (we had so many
applicants that day...it took a while to process the paperwork).

Help.

I am a new ham (about 8 weeks) and love my new hobby. I
have been reading recently about the WARC bands. I have a
Kenwood TS820-S and love it. The only problem is that I
can't work the WARC bands.

Is there any way to modify the rig, or do I need to get hold
of a newer rig and use it mobile and bring it into the house
when I want to work WARC?

Thanks for any help.

This is certainly a complicated hobby.

I visited HAL labs earlier this summer, and they had just sent the proto back to Ray. It is on its way and will probably be a abt a year to 2 years before it is marketable. It will be expensive and slow starting considering the need for two or more of these units for it to work HIHI.

that is all ive heard

1111. Kenwood tm701a resets--cause?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-18 14:54:26 UTC
From: znha@bcrka391.bnr.ca
Message-ID: <1991Jul18.145426.13330@bnr.ca>
Source record: 295184

I own a tm701a, 1.5 years old, original owner. Nice radio.

Earlier, Dave KM3T noted a problem with spurious resets. I'd noticed a similar problem six months after purchase--about a year ago. In the process of looking for flakey in-car wiring, I had it powered up on my bench for about a week. No fault found, problem "went away". What gives?

About a month ago, the problem re-appears. Solution? Send to kenwood, for a "simple fix" they wouldn't discuss...or...

I tried the bench technique again, and it worked for the month. Hmmm. Something more drastic called for.

I checked the lithium cell in the radio (not for the feint of heart) and found the cell at 0.13V instead of the expected 3V. I replaced the cell, a sanyo CR 2032, with a junkbox larger sanyo unit. In the process of re-assembling the unit, I think I know what the problem is.

There's a little metal boss behind the cell, designed to take the screw for the metal face cover. When the faceplate moves, the metal (at ground) can contact the flying lead (positive) of the cell. In my case, by the time I'd realized this, the 3.05V cell had dropped to 2.90V. Drat!

Anyway, a little electrical tape insulated it nicely. The fit is VERY tight, though. I bet during the hot summer days, the metal moves enough to touch the cell, and that's why the problem only happens yearly!

I'd be interested in knowing from other tm701 owners if they've attempted this fix, or having had Kenwood do the work, or what the 'real' fix was.

1112. 6 Meter Info

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-18 14:55:32 UTC
From: psmith@convex.com
Message-ID: <1991Jul18.145532.16918@convex.com>
Source record: 295182

I'm considering getting a rig for 6 Meters. I'd interested in the
experience that others might have had with the Yaesu FT960RII, or
recommendations for other 6 meter rigs that are reasonable in cost
but perform well. I'm interested particularily in an all mode rig,
but portability is not a requirement.

Suggestions for older rigs that I might find used would be helpful also.

Thanks,

Presley Smith psmith@convex.com

1113. Radio Shack 2m/70cm SWR/Power Meter

From: furuta@crayola.cs.umd.edu
Message-ID: <36906@mimsy.umd.edu>
Source record: 295183

I notice in the August '73 magazine a new product mention for a 2m/70cm SWR/Power Meter from Radio Shack. A few months ago there was speculation here about whether Radio Shack planned to introduce 2m transceivers. Does anyone have information over whether this product is an isolated new item or if it represents the start of such a product line?

Also, anyone know anything about the quality of the meter itself?

In the callsign book (forgot the exact title), no hams in N. Korea were
listed. Actually, there was no HM (N. Korea) entry at all. Anybody knows
if there are hams in N. Korea? (No, I am NOT interested in communicating
with them, since (I guess) a national security law prohibits me from
doing that.)

>Ben, DL6RAI

Can't disagree with that, it seemed strange to me that just as the two halves of the country are trying to get back together, the radio hams are trying to emphasize their differences.

I remember reading in one or more of the DX mags that a group of USSR hams were considering an operation from N. Korea, but wanted assurance that it would count as a separate country before spending the time and money to go there and operate. This is the only motivation I can think of for the DXAC decision. If so, we ought to hear it on the air very soon.

Perhaps hams have a vested interest in countries breaking away from each other, rather than uniting. Hands up all those DXers who haven't wondered whether there will be two new European "countries" to work soon... Perhaps there is a dedicated group of DXers who travel the world fomenting revolution everywhere they can - someone must be doing it :-)

1116. What conditions improve TV DXing?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-18 16:09:58 UTC
From: winter@Apple.COM
Message-ID: <55089@apple.Apple.COM>
Source record: 295152

A friend of mine (non-ham) has noticed over the past several weeks
of increased solar activity that he's been able to receive some TV
stations he normally can't. Namely, some stations a few hundred
miles away from him on channels 6, 8, 10, and occasionally 15.

My question to the TV DXers out there is, what's causing this? The
best theory I've heard so far (thanks, Phil!) is tropospheric
ducting. Could that account for enhanced propagation on such a wide
range of frequencies? (ch. 6 is at 82MHz and ch. 15 is at about 475MHz.)

Regarding the AEA Hot Rod length: I no longer have any in hand at the moment, but I seem to recall that the older version (rounded tip) was about 39 inches (very close to the "theoretical" 1/2 wavelength). The newer style (squared tip) was about a half inch shorter. That's one reason I was confused. The length is not the real difference in styles and doesn't explain the difference in resonant frequencies. This leaves the matching section as the only other suspect.

I have been in contact with Dr. Alan Chandler at AEA who has been helping me duplicate AEA's test setup. Turns out they have the same HP 8753 network analyzer (life is tough, isn't it?) that I have available here at work. I was continuing to measure fo of 143 MHz with the squared tip style and 146 MHz with the rounded tip style (sample of two each). Right now, both of my newer antennas are at AEA being reevaluated by Alan. Stay tuned.

I just used my trusty ol' Vibroplex keyer paddle. I taped it to a
wood 1x2 which I mounted so that I could rest my right wrist on
the passenger's seat while sending. It's much safer than working
voice mobile because there's no mic cord to get wrapped around the
steering wheel, and if I need to suddenly pay attention to driving
there is no microphone to hangup/lay down/drop.

1121. Major Solar Flare Alert - X-Class Event - 18 July

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-18 19:06:10 UTC
From: oler@HG.ULeth.CA
Message-ID: <910718130610.20401061@HG.ULeth.CA>
Source record: 295190

-- MAJOR SOLAR FLARE ALERT --

JULY 18, 1991

Flare Event Summary
- No Impact Expected -

MAJOR ENERGETIC EVENT SUMMARY

A major class X1.0/1N flare erupted from a region just now rotating into view around the east limb. The location of the flare was N07E90. The flare was not particularly large in optical extent, although the poor position of this flare made it very difficult to determine the area covered by this flare. As a result, the rated optical size may be in error.

This flare was associated with a strong SWF which extended to the high latitude regions. Simultaneous riometer data shows a brief increase in PCA (to about 1.0 dB) at the peak of this flare event. Absorption levels are now at background levels. No PCA is in progress.

The region responsible for this major flare is not in a good position for analysis. More details regarding its complexity and size will become available over the next several days.

Protons have remained at background levels.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

This last major energetic event will not have a terrestrial impact. However, depending on the complexity of the region in question, future terrestrial impacts from further major flaring may be possible in about a week.

** End of Alert **

>uncomfortable in mobile or too dedo reliably...

I just use a straight key... I have tried iambic (Bencher) paddles, but
I have a tendancy to set them up reeeeeeal tight, so every time I hit
a bump, you got Auto-CW!

The best place to keep a straight key whilst in motion is where your
RIGHT hand would naturally droop, like on the center column or in the
passenger's seat (providing there's no passenger ;-)).

I try to get on 20 CW when I'm in the car on trips around the Bay Area,
or even better, 6 CW if the band's open.

Date: 1991-07-18 20:37:57 UTC
From: mlau@pollux.svale.hp.com
Message-ID: <4680010@pollux.svale.hp.com>
Source record: 295223

Hi,

For those if you who have HT's with all those nifty features, here is
a question:

1) Can you program your HT to go on at a certain time and then go off ?

2) If above is true, then can you program the HT so that it can go every
N hours and then turn itself off after X mins?

3) When using the DTMF decode for code/group (ie NNN*NNN):
a) does the HT beep as well as display the calling code/group
b) if so how long does it beep ?
b) does the squlech opens up ?

Note: I am not talking about the calling feature some HT's have with
PL tone decode.

4) Do you know what HT models have these features ?

Thanks,

```

1124. Disable TS-440 BCB attenuator (How?)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-18 20:44:22 UTC
From: flash@lopez.UUCP
Message-ID: <1991Jul18.204422.27836@lopez.UUCP>
Source record: 295197
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

Well since I am sending my 440 to AES to be fixed (hit by lightning) I decided I would have some of the mods done that I have been meaning to do for the past few years.

I joined the kenwood users group about four years ago, and they had a mod to disable the BCB attenuator so enhanced MW reception is possible.

I recall that the mod involves cutting a wire and putting in a jumper. I have been looking for the mod all afternoon in my file cabinet and (Curses) I can not find it.

Anybody know what and where and can tell me clearly so I can pass this on to AES? I need to know pretty fast cause the radio is in the box, and I am writing up the note to tell them what to do.

Thankee.

In INFO-HAMS digest #519, Brent Mosbrook, KC6MWK writes:

>Apparently Yaesu has done one better on the mod to receive extended UHF.
>Some of the radios cannot scan up, but there is now a fix to change the
>lower and upper limits... ...Does anyone have this in ASCII??? I am sure
>it would be of interest to the legions of 470 users!!

I took the original post from Brian Murrey - KB9BVN and played around, coming up with the following (as I'm sure others have, too). There are probably a number of reasons why this may not work for all units. My 470 was one of the first received at the place I purchased it and is a very early model. What follows is about 170 lines long. Sorry...

Reid, WB7CJO

- - - - - - - - - - -

Synopsis:

This procedure appears to force a non-standard frequency into a VFO, which is then stored as an Upper Limit in the "U" memory where the operator can modify it as desired using the MT function.

A similar procedure follows for setting a lower UHF limit and capturing it in the "L" memory, plus a similar method for the VHF band.

To use the mods after you have stored them, you must select the "U" or "L" memory channel (which ever is closer to your target frequency). Then select the memory tune function by pressing the (MR) key to get the "MT" indication below the memory number display. Once the correct frequency is obtained, you can program it in any memory.

- -

For these steps to work properly, I had to have "Beep" enabled and *NOT* have the "L" and "U" memories locked out.

- -

Steps for setting the UPPER UHF limit to 500 Mhz

1. Program the frequency for 430.00 mhz *SIMPLEX*.
2. Press the (FM), then the (RPT) button for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press the (RPT) key twice for a "+" (plus) offset indication.
6. Press the (REV) button once.
7. The radio should now display 1430.00 mhz.

8. Press (FM) then hold the (Down Arrow) key to lower the displayed
frequency. Stop when 500.00 Mhz is displayed.
9. Press (RPT) once to select simplex operation.
10. Press (FM) and hold until you hear two beeps.
11. Rotate the (DIAL) knob until the channel "U" is displayed.
12. Press the (FM) key again, you should hear a beep.
13. Press the (FM) and (RPT) keys and enter 0500.
14. Turn the radio off, then on again.

- alternative procedure (faster but a little more complicated)

8. Press (RPT) twice to select the "-" repeater offset.
9. Press (REV) twice. Frequency shown should be 630.00 Mhz.
10. Press (FM) then hold the (Down Arrow) key to lower the displayed
frequency. Stop at 500.00 Mhz.
11. Press (RPT) twice to select simplex operation.
12. Press (FM) and hold until you hear two beeps.
13. Rotate the (DIAL) knob until the channel "U" is displayed.
14. Press the (FM) key again, you should hear a beep.
15. Press the (FM) and (RPT) keys and enter 0500.
16. Turn the radio off, then on again.

Steps for setting the LOWER UHF limit to 400 Mhz.

1. Program the frequency for 450.00 mhz *SIMPLEX*.
2. Press the (FM), then the (RPT) button for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press the (RPT) key once (for a "-" (minus) indicated offset).
6. Press the (REV) button *THREE* times.
7. The radio should now display 050.00 mhz.
8. Press (FM), then hold the (Up Arrow) key to increase the displayed
frequency. Stop at 400 Mhz.
9. Press the (FM) key and hold until you hear two beeps.
10. Rotate the (DIAL) knob until the channel "L" is displayed.
11. Press the (FM) key again, you should hear a beep.
12. Press the (FM) and (RPT) keys and enter 0500.
13. Turn the radio off, then on again.

- alternative procedure
- note: this short-cut requires you to enter 430.00 Mhz in step 1.

5. Press the (RPT) key twice for a "+" (plus) indicated repeater offset.
6. Press the (REV) button once.
7. Press (RPT) twice to select the "-" (minus) repeater offset.
8. Press (REV) once. You should have 1030.00 Mhz displayed.
9. Press (FM) and hold the (Down Arror) stopping at 999.00 Mhz.
10. Press (REV) once. You should have 399.00 Mhz displayed.
11. Press (FM), then hold the (Up Arrow) key to increase the displayed
frequency. Stop at 400 Mhz.

12. Press (RPT) twice to select simplex operation.
13. Press the (FM) key and hold until you hear two beeps.
14. Rotate the (DIAL) knob until the channel "L" is displayed.
15. Press the (FM) key again, you should hear a beep.
16. Press the (FM) and (RPT) keys and enter 0500.
17. Turn the radio off, then on again.

- -

Steps for setting the UPPER VHF limit to 200 Mhz.

1. Program the frequency for 140.00 mhz *SIMPLEX*.
2. Press the (FM), then the (RPT) button for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press the (RPT) key twice (for a "+" (plus) indicated offset).
6. Press the (REV) button *ONE* time.
7. The radio should now display 1140.00 mhz.
8. Press (FM), then hold the (Down Arrow) key to decrease the displayed
frequency. Stop at 800 Mhz.
9. Press (RPT) twice to select the "-" (minus) repeater offset.
10. Press (REV) once. You should have 200.000 Mhz displayed.
11. Press (RPT) twice to select simplex.
12. Press the (FM) key and hold until you hear two beeps.
13. Rotate the (DIAL) knob until the channel "U" is displayed.
14. Press the (FM) key again, you should hear a beep.
15. Press the (FM) and (RPT) keys and enter 0060 (600 Khz repeater offset).
16. Turn the radio off, then on again.

Steps for setting the LOWER VHF limit to 100 Mhz.

1. Program the frequency for 140.00 mhz *SIMPLEX*.
2. Press the (FM), then the (RPT) button for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press the (RPT) key twice (for a "+" (plus) indicated offset).
6. Press the (REV) button *ONE* time.
7. The radio should now display 1140.00 mhz.
8. Press (FM), then hold the (Down Arrow) key to decrease the displayed
frequency. Stop at 1100 Mhz.
9. Press (RPT) twice to select the "-" (minus) repeater offset.
10. Press (REV) twice. You should have 100.000 Mhz displayed.
11. Press (RPT) twice to select simplex.
12. Press the (FM) key and hold until you hear two beeps.
13. Rotate the (DIAL) knob until the channel "L" is displayed.
14. Press the (FM) key again, you should hear a beep.
15. Press the (FM) and (RPT) keys and enter 0060 (600 Khz repeater offset).
16. Turn the radio off, then on again.

- -

Notes:
To use the higher frequencies you have to select the "U" channel
and press the (MR) button. This puts the handheld in the "MT" (memory
tune) mode. From there you can scan down or use the (DIAL) knob to go
to a lower frequency. ...Likewise for the lower frequency memory. Any
frequency selected using this method can be stored in any memory.

My radio will not let me go up in frequency, only down. If I try, the
rig will default back to the original ham band. I had to be careful
when doing these mods.

One trick I found when initially setting up the VFO with the expanded
upper and lower frequencies is that in steps 5 (and 9) if you select "+",
pressing (REV) adds 1000 Mhz to the display or subtracts 1000 Mhz if it
has already been added. If you selected the "-" (minus) repeater offset,
pressing (REV) will subtract 400 Mhz if the displayed frequency is 1000
Mhz or higher, or subtract 600 Mhz if the displayed frequency is below
1000 Mhz, until any more subtractions would run the frequency negative,
after which it alternatively adds or subtracts 600. You can mix the
(Up Arror) (Down Arrow) method with the "+ -" offset/(REV) combination
to reduce the time getting to the desired frequency. With these tricks,
many permutations can be found to get where you want to be very quickly.

Ok,

The author of that last message tuned the VHF band to 100-200MHz.. Does anyone know what the relative sensitivity of the 2m brick is on that frequency span? Otherwise the mods work great!! I was just wondering if I should do the extended mod for 2m as well.. Thanks!

Message-ID: <37B0D9ECE000B86A@ulkyvx.bitnet>
Source record: 295204

I was talking to some guys on the local repeater the other morning about NASA Select. We thought that it would be a good club activity to rebroadcast NASA Select on an ATV transmitter during a shuttle mission. Getting a downlink isn't much of a problem for us. One or the other of us can get access to a downlink. I think we can also get a couple of good transmitter sites that would allow a wide coverage area. The University has an instructional TV facility with a C-band downlink that I could probably get access to. We also have a freestanding 300 foot tower that would be ideal for the transmitter. The whole facility is right next to where I work so attending the system would be easy. See? The technical stuff is no problem.

We are concerned about regulatory restrictions. How does this fit? It would seem by it's very nature to be broadcasting. I know there are places that do this every mission. I'd like to hear from you and see what you did, if anything, to get authorization.

Please respond directly to me. I'll post a summary to the net if there's enough interest. Thanks in advance!

Thanks to Terry Wells for doing the fine job of documenting the Yaesu FT470 out of band mods. I might note that the information that Yaesu is sending out is from the Info-Hams posting of a few days ago.

Pete McAfee kd6hr
internet: kd6hr.el_segundo@xerox.com
==========

Until now, I had always followed the directions to the letter. But I decided it was time to analyze the side effect a little further. Here's what I found.

Initial conditions for the side effect to occur:

1) Go to VFO. (VFO A or B will work, it doesn't matter.)
(Press VFO)

2) Any frequency will work, In the initial example, 450.00Mhz was used.
(Enter 50.00 from the keypad - radio goes to 450.00)

3) Set the repeater offset to 0.00MHz, but do not press any other buttons.
(press F(M), press RPT, type 0000. Don't press anything else)

4) Turn the power off and on again. (Radio will return to VFO mode)
(Twist left until the click, twist right past the click. Neat, huh.)

This sets up the radio so that the side effect can exist. Once the side effect exists, you do not have to repeat steps 1 - 4 unless you change the repeater offset and want the side effect back again.

To make use of the side effect, follow these steps:

1) Set transmit offset to + (- works too, but slightly differently, see section on low limit mod for details)
(Press RPT twice)

2) Swap the transmit and receive frequencies.
(Press REV)

At this point, the computer gets confused since the transmit and receive frequencies are supposed to be the same (repeater offset = 0). The resulting side effect is that 1GHz is added to the current frequency. Pressing REV repeatedly alternately adds and subtracts 1GHz. Caveat: This is only true if one of the two frequencies (ex: 450.00 and 1450.00) is inside the currently available range of frequencies. If you have expanded the range of your receiver to 500Mhz, you may add 1GHz to achieve a new receive frequency of 1500MHz. You may not, however, continue leap frogging ad infinitum. The highest possible frequency is 1599.990 (with STEP(7) set at 10KHz). Leaping

from 600.00MHz goes to 0.00MHz. This, in itself, is useful, as you may tune up from 0.00MHz and get any frequency down there that you want.

Due to a loophole in the tuning software, you may tune from the current frequency towards the normal operating range (430.00 - 450.00), but not away. Once you tune down to a range in which the receive circuitry is sensitive (about 500MHz), you should store that frequency in the U memory. This now becomes the new upper frequency limit for the receiver (sort of).

Unfortunately, you are still subject to the "tune one way only" syndrome. To bypass it, you must store some frequency in the L memory. It doesn't matter what this frequency is, but it has to be below the U memory and, preferably, below any other frequency you want to use. You may store a very low frequency here too (0.00MHz).

BUT, the software isn't that dumb. To trick it, both the L and U memories must be filled and active (not set for SKIP), AND you must access the out of band frequencies from the MT (memory tune) mode, AND you must start from either the L or U memory.

To use MT:
1) Press MR and select either the L or U memory.
2) Press MR again, a small MT should appear on the left of the display.
3) You may now tune with the arrow keys, Dial knob, or directly enter frequencies with the numeric keypad.

The "NEW" lower limit side effect:

Thanks goes to Pete McAfee, as he managed to run across yet another angle to this side effect. I have modified his procedure slightly as it isn't really necessary to key the transmitter. Pressing the REV key has the same effect.

As you may recall (read the first part again if you forgot), setting the transmit offset to + and pressing REV alternately added and subtracted 1GHz from the current frequency. If you set the transmit offset to - and press REV, one of two things will happen. If you are above 1000MHz, the current frequency will drop by 400MHz (In Pete's example, 1450.00 dropped to 1050.00, and then to 650.00) Once you get below 1000MHz, the frequency will start shifting by 600MHz steps. If it is below the normal range (430.00 - 450.00), it will shift up. If it is above, it will shift down.

Repeatedly pressing the REV key with RPT set to - yields these results:
Frequency will swap between:
0.00MHz and 600.00MHz
100.00MHz and 700.00MHz
200.00MHz and 800.00MHz
300.00MHz and 900.00MHz
Or any variation inside those limits. (250.00MHz <--> 850.00MHz)

however,
400.00MHz --> 1000.00MHz --> 600.00MHz and we go back to case #1.

Using this information you may tune to any frequency you wish. Unfortunately, the Rx hardware isn't sensitive very far outside its normal range.

I currently have my UHF section set at 400.00MHz lower and 508.00MHz upper. It works great!

Note!!!!!!!

Be aware that this effect works on the 2 meter section as well. Since the 2 meter section is sensitive to a lower frequency range, you might want to experiment down there too.

1134. `Boat-Anchors' (was "Free Teletypes")

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-19 15:28:00 UTC

A couple of our `members' (Clark, WA2UNN and Mike, WA6ILQ)
are trying to `come-across' as `Nice Guys', offering `free'
Model 15 Teletype machines (+ assorted paraphenalia).

This ... this is just TOO MUCH for me to sit quietly by
and say nothing. Come on fellows ... tell the `new-kids'
the REAL STORY!

We've got a lot of new hams who read this stuff, and they
may INNOCENTLY believe these `wonderful offers'.

Have you guys told `em that they'll have to make sure that
their house foundations can take the additional load?

Have you told `em that they'll live with the smell of that
stinky teletype oil day-in and day-out?

Have you told `em about the clickty-clack of all those
zillions of gears and cams, whirring-about?

What about the unhearlded dangers of selenium rectifiers?
(were they still using them in the Model 15 power supplies?)

I'm .... SHOCKED .... at this attempt to pass-off the symbols
of a bygone era, to the new generation.

Besides, with the way that the Model 15's are built ...
someday in the future, the receipients of this `generousity'
will have to try and pass this stuff `off' to another generation!

Paul Nix (WB5AGF)

I just got a copy of ARRL's "Now You're Talking" and their packet radio book.
I am very interested in getting into ham raadio, but I need some advice:
a) what kind of used equipment should I look for in HF/VHF (new stuff is $$$)
b) where besides the swaap newsgroups is a good place to look for a)
c) when I get my license, will I also be able to use it in Germany -
I am getting transferred there after finishing my MS here next year

Please send me e-mail directly, as I am sure that folks on this net don't
want to wade through this novice stuff.
Thanks,
Dave

Fellow hams,

I need a semi-automatic key, commonly known as a bug. I
prefer the Speed-X model made by E. F. Johnson, but will consider
Vibroplex or other types. Does anyone have one for sale?

I have a medical condition, called cwus fistivus, which
prevents me from using an electronic keyer or keyboard. Thanks for
your help in advance.

Of course there is a real opportunity to make money off these old beasts.

Essentially what you do is sell one each to the local news broadcasters.
All TV newsrooms need the sound of the whirring gears and the hammers impacting
the platen to sound like a real newsroom. :-)

>writing up the note to tell them what to do.

Funny you asked! I have a brand new Kenwood TS-850S and was not happy
with the BCB performance. In short, Kenwood was no help, but through a
friend, I was informed that the area to focus attention to is in the
bandpass filtering area.
For what it's worth, I'll tell you how I modified the 850. Perhaps it
might help, perhaps not....you could steer AES in the general direction, anyway.
Each band has it's own bandpass filtering network. Where you want to focus
your efforts is in the specific filter for the .500-1.6 meg range. If you
have a schematic, concentrate on the "RF BOARD" area. The 440 may have a
filter board instead of a rf board as my 850 has. Anyway, you will see a
number of bandpass filters for each set of freq's for that particular
band.
I located the two inductors involved in the filter on the rf board which
helped me locate the two 150 ohm resistors used to attenuate the BCB.
On my radio, most components are surface mounted and are not identified
or marked on the board in any way. A full blown service manual would
identify the suspect resistors, but I don't have one, so I took a chance
and guessed which ones they were by first locating the inductors (which
are clearly marked as being L8 and L9) and then tracing the signal path
from the coils to the only 150 ohm resistor pair that happened to be in
series with the output of those coils. Sounds difficult, but it's really
not!!! A simple jumper across these two resistors brought the signal
strength up considerably!
I heard stories that if this mod were done, all AM BCB stations would
become distorted.....NO WAY! I can tell you firsthanded that this is
simply NOT TRUE! I can not find ANY adverse effects to any other function
of the radio either!
Please bear in mind that this is the 850 I'm talking about, however I
have come to learn that most Kenwood rigs of recent years have
relativly the same bandpass filter design. The element to jump always
seems to be the resistor(s) in series with the bandpass inductors!
If I can be of any other assistance, don't hesitate to E-mail me or
call the office......73 (-| Dave |-) KA3PGN

REAL mobile CW ops use mechanical Vibroplex keys. Gotta watch the star-
board corners, though. Man, love them dits.....

You also gotta use cathode keying on a 6146 final. That way, when
you get your fingers across the key, you can send from the back seat.

1146. Is the Icom R1 good or bad ?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-19 23:33:53 UTC
From: etxsral@hal.ericsson.se
Message-ID: <1991Jul19.233353.1925@ericsson.se>
Source record: 295215

Does anyone have experience in Icom R1 ?

I bought a Icom R1 yesterday and found some very bad things.

My unit seems extremely sensitive to cross & inter modulation
even with the supplied (bad) rubber ducky.

An example: On 77.9 Mhz I receive the mirror of a broadcast
transmitter on 99.3 very strong. (about 30 km away)
99.3 - 77.9 = 21.4 Mhz !

I thought this unit had triple conversion with a first IF of
266.7 Mhz in NFM & AM ?

This seems worse than my old Regency M400 :-(

Close to my monitor position is some mobile phone base stations
that transmits in the 460-463 Mhz range and I can receive them
everywhere in the 250 - 500 Mhz range.

Is the Icom R1 such a bad receiver or is my unit broken ?

Any opinions ?

But in another 50 years they will be Valuable Collectors Items; and
there will be newsletters and swap meets and displays in shopping malls
and little shops all over town selling them. And books, showing
how to tell the Real Teletype from an imitation, and giving price
guides by serial number.

An alternative use that can extend the life of _real_ teletypes
indefinitely is as follows:

Remove the perspex see-through portion of the fold-up lid.

Fill the cavity below this area (between keyboard and platen) with good
quality potting soil

Plant favorite flowers (Petunias? or maybe succulents if you tend to
be forgetful about watering...)

Enjoy a bright spot in an otherwise sterile shack.

Ideally it would be better to remove some of the guts first and line
the cavity with plastic (avoid water dripping through) but it is important
that keyboard and platen remain intact (retaining their "look and feel")
for maximum enjoyment.

The old Texas Instruments "Silent 700" terminal is also a good candidate
for this kind of treatment, and you can even leave a real phone handset
embedded in the cups of the acoustic coupler for added effect.

Dave,

I'll try to answer a few of your questions. First of all there WAS an amateur radio station in Weil Hall (yup...I'm an alumni)...see Dr. Leon Couch in the EE department. He will be able to put you in contact with folks teaching classes and giving tests locally. As far as equipment is concerned, I've always had lots of luck buying used equipment at Hamfests (most have fleamarkets). The closest is probably in Orlando...there was also a branch of Ham Radio Outlet there. Check the phone book. As far as operating in Germany goes, the U.S. has cross-licensing agreements with most countries...contact the FCC or the state department for details.

Hope you get your license. Ham radio is a great hobby!!!

1150. AEA Isoloop Question

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-20 03:04:00 UTC
From: WAS%UHHEPG.BITNET@cornellc.cit.cornell.edu
Message-ID: <7310419800000270@uhhepg.bitnet>
Source record: 295219

I have been using an AEA Isoloop in a townhouse attic
for several months with better results than I got from a random wire
and better results than from resonant wire dipoles.

The Isoloop has much better noise characteristics on receive than
any other ant tested by me.

I also compared the attic QTH with another, far better QTH. I estimate
that I loose three s-units due to the roof and walls.

TVI and RFI at 100 watts virtually knocked me off the air with the
random wire and with the dipoles. I have some problem on 15 meters but
so far so good on 10 and 20.

For this QTH the AEA Isoloop is the best ant yet. Many and regular
DX contacts.

1151. Solar Terrestrial Forecast and Review

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-20 03:57:23 UTC
From: oler@HG.ULeth.CA
Message-ID: <910719215723.2020034c@HG.ULeth.CA>
Source record: 295221

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
July 19 to July 28, 1991

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008

Based In-Part from Data Supplied By
The Space Environment Services Center

SOLAR TERRESTRIAL REVIEW FOR 12 JULY TO 18 JULY

Solar activity this week was generally low to moderate. Late in the week, activity picked up with several episodes of high activity. The minimum rotational 10.7 cm solar radio flux was observed this week. This minimum value of 159 was observed on 17 July and was short-lived. By 18 July, the return of old Region 6694 (this time numbered as Region 6734) and several other regions in the same longitude band came into view, producing a large 30-point increase in the solar flux.

The most significant activity this week occurred in Region 6729 (now a relatively simple beta group) and new Region 6734 on the east limb. Region 6729 produced a surprisingly large class X1.1/2B tenflare at 06:37 UT on 17 July. This event was accompanied by a moderately strong Type II burst and a strong Type IV sweep frequency event. The flare was located east of the central meridian, at S21E43 and was of average duration. The event began at 06:19 UT, peaked at 06:37 UT and ended at 06:52 UT. A fairly strong SWF was observed during this flare, but was not of a particularly great duration.

The second major flare occurred on 18 July, at 14:41 UT. This event originated from just behind the east limb, from new Region 6734 (at N07E90). The event began at 14:25 UT, peaked at 14:41 UT and ended at 15:19 UT on 18 July. The flare, rated a class X1.0/1N event, was reported to be associated with a loop prominence system. A strong spray was also observed out to about 0.5 solar radii. The optical size of this event is subject to error due to the poor position of the flare. There were no sweeps with this event and the radio bursts were rather weak. However, this flare was associated with a strong SWF that was observed even over many high latitude regions. An associated PCA burst (proton unrelated) of about 1 dB was observed with high latitude riometers at 14:50 UT corresponding with the peak X-ray flux.

Region 6734 is beginning to show more of itself with each passing day. At the present time, about the only thing to report is that this region is of a moderately large size with a healthy penumbral mass and fairly strong

magnetic fields.

M-class flare activity has increased over the last 24 hours. A period of active C to M class flaring was observed on 18 July following the large X-class flare.

Geomagnetic activity this week ranged from quiet to near severe storm levels. The most active day of the period was 13 July, where major to severe storming was observed over all latitudes. The storm was rated as major, but narrowly missed a severe classification. The estimated planetary A-index for 13 July was 98. Boulder reported an A-index of 73. K-indices ranged from 5 to 7 over the middle and low latitudes, while high latitudes observed K-indices between 6 and 9. A few periods of magnetopause crossings of geosynchronous satellites was also observed on 13 July. The cause of this activity is suspected to be from the major class M7/3B tenflare of 11 July. Since then, activity has been relatively unsettled. A recent sudden impulse was observed at 19:02 UT on 19 July and has been followed by minor storm periods. There are a number of possible sources for this activity: the X-class flare of 17 July, well placed coronal holes and a few recent disappearing filaments.

A major auroral storm developed on 13 July. Activity was most intense during the local early morning hours of 13 July. Observations of auroral activity have been received primarily between the high latitudes and central middle latitude regions. Activity was intense enough to be observed quite widely over Australia and New Zealand on 13 and 14 July. Due to the timing of the storm, the best observation locations were from Australia, New Zealand and parts of Europe (particularly the more northern areas). By 14 July, activity over North America was not as luminous, but was still high enough to produce zenith aurorae from as far south as the Canadian/U.S. border and the northcentral/northeastern U.S.. The activity was not quite intense enough to provide particularly good viewing conditions over the southern U.S. states or lower latitudes.

HF propagation conditions have been normal to slightly below normal this week. The storm of 13/14 July produced strong degradations in signal propagation over almost all latitudes, but particularly over the middle and high latitude regions. Conditions gradually improved on 15 and 16 July. Recent major flaring and minor M-class flaring have caused periods of moderate SWFs over most sunlit latitudes (mostly the middle and low latitudes).

VHF conditions ranged from normal to below normal. The major geomagnetic and auroral storm of 13/14 July provided very favorable conditions for VHF backscatter and auroral sporadic E over the middle and high latitude regions. European, Australian and New Zealand regions appear to have had the best opportunities for storm-related VHF enhancements and associated anomalies. Conditions deteriorated on the 14th and by 15 July, conditions were generally unfavorable for backscatter.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is on the rise. Daily M-class flares are anticipated over the next week or two as several major active centers rotate back into view. Region 6734 is presently the most potent region visible and will likely be associated with several additional major solar flares as it transits the visible disk. Activity should remain mostly moderate, with isolated major periods over the next two weeks. Major terrestrial impacts from solar flaring is not expected until after about 25 July, but this is entirely dependent on how energetic the activity is.

Geomagnetic activity is expected to be near or slightly above the minor storm level threshold over the next 24 to 48 hours. Thereafter, a decline to more dormant levels can be expected (barring future major solar events). Should major flare activity produce terrestrial impacts, major storming could be observed. There is a moderate risk for a major to severe geomagnetic storm sometime over the next two weeks, dependent on solar activity. For this reason, the confidence levels for most of the forecasts in this STFR report are lower than normal.

Auroral activity is expected to be mostly low to moderate over the high to northerly middle latitudes. A few periods of high activity may be observed over the high latitudes during the local evening and early morning hours of 19/20 July, although no significant auroral storming is expected. There is also a risk for higher levels of auroral activity during the local evening hours of 21/22 July. Thereafter, conditions should become more dormant barring further energetic solar events. There is a moderate risk for a major auroral storm sometime over the next two weeks associated with solar flaring. The time of occurrence and intensity of any future auroral activity will of course depend on the time and severity of solar activity. Watch for future major flare alerts and/or storm warnings for additional information.

HF propagation conditions will continue to be generally good to fair over the low and middle latitudes. High latitudes will experience generally fair to poor conditions until after 22 July when improvements may take place. There will be periods of degraded conditions (SWFs/SIDs) over the next week or two associated with minor and possible occassional major solar flaring. These degraded conditions will be limited to the sunlit hemisphere. There is a moderate threat for a major HF disturbance sometime over the next two weeks associated with particularly energetic solar activity.

VHF propagation conditions should remain generally normal throughout the period. There is a notable chance for possible VHF enhancements during the daylight hours over the low and middle latitudes over the next two weeks. Signal strengths may be somewhat unstable, but may also be slightly stronger than usual. There is a slight chance for favorable backscatter conditions developing sometime over the next week or two, again dependent on solar activity and associated geophysical impacts.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 19 JULY

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

NOTES:
Left-hand column digits represent the 10.7 cm solar radio flux
obtained from Ottawa. The right-hand column describes the relative solar
activity for that period based on the average number of major and minor
flares that can be expected for related solar flux values. Plot lines
labeled with the letter "F" represent days where at least one major flare
occurred (ie. class M5 or greater flare).

NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "oler@hg.uleth.ca". This document, as well as others and significant data/forecasts exist on the STD BBS at: (403) 756-3008.

** End of Report **

1152. Gotta love that Es

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-20 05:12:13 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <46558@netnews.upenn.edu>
Source record: 295225

Any netters out there catch the Es opening this evening (slightly after
0000Z 7/20)? The band was open for a little less than an hour in these
parts (FN20/FM29) down to central Florida and the Florida panhandle.
I only caught the middle of it but was able to work EM70 twice and
EL87. Heavy QSB, but much of the time sigs were S9+. Did any other
areas experience any Es aside from the mid-Atlantic -to- Florida hop?

1153. Major Solar Flare Alert - X-Class Event - 20 July

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-20 05:55:40 UTC
From: oler@HG.ULeth.CA
Message-ID: <910719235540.202003d1@HG.ULeth.CA>
Source record: 295224

```
-- MAJOR SOLAR FLARE ALERT --

JULY 20, 1991

Flare Event Summary
- No Impact Expected -

--------

MAJOR ENERGETIC EVENT SUMMARY

A rather impulsive major class X1.0/2N tenflare erupted from Region 6734
early in the UT day of 20 July. The event began at 01:35 UT, peaked at 01:49
UT and ended at 02:07 UT on 20 July. This event was associated with an
importance 2 Type II sweep, but appears to have been lacking a Type IV. The
radio spectrum was not particularly impressive with this event. A moderate
intensity, but rather short-duration SWF was observed in conjunction with
this last major flare.

Region 6734 is slowly rotating into better view. It presently appears
as a healthy sized DKI spot group located at N07E76. South of Region 6734
lies new Region 6737 (S12E72) which is also a respectable eruptive region.
It was responsible for an impulsive class M2.0/SF event at 17:26 UT on 19
July.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

There is not expected to be a terrestrial impact from this latest
energetic event. However, Region 6734 will demand close attention over the
next two weeks as it transits the solar disk. Impacts may become possible
after approximately 23 or 24 July. Impacts may possibly include proton
and PCA effects.

Occassional major flaring is expected to continue from Region 6734 and
possibly from Region 6737. This is the second major X-class flare for Region
6734. It should continue to produce periodic major events.

** End of Alert **

mlau@pollux.svale.hp.com (Mel Lau) writes...
>1) Can you program your HT to go on at a certain time and then go off ?

Well, sorta mostly. You can separately program an On-time and a Time-out
time (shut down after {20,40,60} minutes after no switch is pressed and no
signal received).

>2) If above is true, then can you program the HT so that it can go every
> N hours and then turn itself off after X mins?

Nope, not unless you program it again...

>3) When using the DTMF decode for code/group (ie NNN*NNN):
> a) does the HT beep as well as display the calling code/group
yes
> b) if so how long does it beep ?
just briefly
> b) does the squlech opens up ?
no

> Note: I am not talking about the calling feature some HT's have with
> PL tone decode.
Code-squelch (separate from Tone-squelch) and Pager functions are both
enabled by adding a UT-49 DTMF decoder, the rest of the smarts are
already in the CPU.

>4) Do you know what HT models have these features ?

Well, I imagine the IC-nSAT are all pretty similar.

W1JR in Amherst, NH, worked K4RZB in EM70 at 0056Z on 7/20. The only other time I remember working FLA up here was on a meteor scatter QSO many years ago.

1156. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-20 14:57:03 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9107201457.AA13239@blackbird.afit.af.mil>
Source record: 295128

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* UoSAT-F LAUNCHED! *
====================
Keplerian elements have arrived from the radar trackers, with
seemingly 'temporary' object numbers. Of the following 5 sets, we
believe that UO-22 is the earliest object, which we have called object
'V44-E'.

V44-A
1 82061U 91199.96310366 .00006425 00000-0 23317-2 0 75
2 82061 98.4598 273.8322 0005242 119.3090 240.8638 14.33593489 274
V44-B
1 82062U 91199.96056641 .00005709 00000-0 19954-2 0 42
2 82062 98.5414 273.7730 0004835 208.4705 151.6230 14.35540635 279
V44-C
1 82063U 91200.03066496 .00038228 00000-0 13287-1 0 58
2 82063 98.5397 273.8415 0003272 203.4556 156.6405 14.35260616 282
V44-D
1 82064U 91200.09958995 .00010685 00000-0 36992-2 0 66
2 82064 98.5409 273.9104 0005529 213.1950 146.8915 14.35813888 299
V44-E
1 82065U 91200.09919883 .00012853 00000-0 44201-2 0 72
2 82065 98.5401 273.9126 0006983 211.0882 148.9904 14.36094884 291

We have only limited news concerning the other microsats launched on V44.

TUBSAT - automatic transmitter activation confirmed
ORBCOM-X - no firm data available to us
SARA - listen on 145.995 MHz, automatic transmitter activation expected

ERS-1 has completed its panel and antenna deployments successfully.

UO-22 is now transmitting 9600 bit/second FSK AX.25 status messages and telemetry. Many reception reports have been received on UoSAT-OSCAR-14. Thanks to all of the stations who have monitored and reported.

Martin Sweeting has returned to UoS from the launch site, and a minor celebration was successfully completed. There are still several delicate operations to complete before UO-22 is commissioned, but we've accomplished a lot in the last 66 hours.

A reminder to ALL groundstations that any uplinking to UO-22 will interfere with command station data gathering and slow the commissioning process. In some instances (e.g. boom deployment) this is highly undesirable. Please do not transmit to UO-22.

73,

Jeff Ward, G0/K8KA @ UoSAT Mission Control

* SHUTTLE LAUNCH *
==========
An electrical problem will delay the launch of the Space Shuttle until Wednesday morning, 24-Jul-91.

* SATELLITE OF THE WEEK *
==========
The "Satellite Of The Week" installment is in response to numerous requests for amateur satellite transponder passband and beacon frequency information. All active amateur satellites will be covered in the upcoming weeks.

Name : AMSAT-OSCAR-10 NASA Catalog Number: 14129 Launched on 16-Jun-83
Orbit : High-altitude, elliptical, synchronous-transfer, Phase 3, Molniya

Transponder 1: Mode B Linear, Inverting

Uplink Passband : 435.027 - 435.179 MHz
Downlink Passband : 145.825 - 145.977 MHz

Downlink = 581.004 MHz - uplink frequency (MHz) +/- Doppler (5 KHz max)

This satellite experienced OBC failure in December 1986. Therefore, no other transponders or beacons are active. Since control of this spacecraft was lost, transponder operations must be made according to schedules provided by the satellite controllers.

* THANKS! *

We have a problem setting up subtone frequencies on a friends's HT.
Preessing the function key and then either the "5" or the "6" keys
gives an error message "Error" on the LCD display. Any ideas???

Thanks in advance,
Earl, 4Z4TJ

Come on Paul! I think everyone should have the experience of a model 15! It is an absolutely incredible example of electro-mechanical engineering! It is also an excellent teaching aid! There is a brilliant example of serial-to-parallel conversion in the 15 and an even better one of parallel to serial in the model 14 transmitter/distributor.
(You just cant explain the workings of a UART any better!)

To think these machines were first built in the 1930's and stayed in the same form for better than 30 years (just look at a seimens 100, built in the late 60's and mechanically almost identical to the model 15).
Its a great testiment to the engineers at Teletype. (Alas AT&T Teletype ne Western Electric Teletype is no more).

If anyone in the DC/VA/MD area has a model 15 in good cndx the want to get rid of, I'd certainly take good care of it!! (I also had a Seimens 100 back in OZ but it had a 240Volt 50Hz synchronous motor!)

1160. Re: Info on mods for 1750 Hz. tone burst NEEDED!

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-20 18:11:46 UTC
From: allbery@NCoast.ORG
Message-ID: <1991Jul20.181146.15653@NCoast.ORG>
Source record: 295134

As quoted from <19130008@hp-ptp.HP.COM> by bmp@hp-ptp.HP.COM (Brian M. Perkin):
+---------------
| My TH-75A appears to be able to generate 1750. I'll check the manual
| and listen to it do it. 1750 is one of the options in the PL tone
| select sequence and there definitely is not a 1750 hz subaudible tone.
+---------------

I've already confirmed it both in the manual and on the air: setting the PL
to "1750" causes it to send a tone burst at the start of transmission.

I'd like an all-mode (and I mean ***ALL***, not just a few like they have now under the lable of "all mode"), 28-1300+ MHz transceiver. It should have everything in one box, or else all the control and CPU functions in the box with the reciever and a separate transmitter. Modular addition of bands is acceptable ONLY if the modules are added INSIDE the boxes (no pile of boxes with dozens of interconnecting cables). Separate band antenna connections preferred.

Also, and FM (AM+SSB would be nice, too) unit for mobile use. Again, it should have ALL bands from 28-1300 MHz in ONE BOX ONLY! I would only need 25 watts up to 450 MHz and 10 watts above that. Separate band antenna connections preferred.

And of course an all band HT. Since fitting all that in will be tough enough as it is, make it a LARGER size (e.g. as an Icom IC-32AT) before making the smaller ones.

Using the technology that can put 2 bands and very extended receive into an IC-24AT you can surely put at least 4 bands into the size of an IC-32AT. Think of what can be done in 3 years or so.

I also worked K4RZB at 0100Z on 20 July. My station is far lees than
Jim's. I'm running a Jr. Boomer at 35 feet (below the tree line!) at a 200 foot
ground elevation and 150 watts. He gave me a 5x9. That was one very unusual
opening!!!

1165. Icom battery pack too good to be true?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-21 00:58:06 UTC
From: seligman@CS.Stanford.EDU
Message-ID: <1991Jul21.005806.13606@neon.Stanford.EDU>
Source record: 295139

A friend just brought me an Icom BP-82 battery pack from Japan.
All the spec sheets I've seen say that the BP-82 is a 300mAh
battery. I went to a store to check on it. Sure enough: 300mAh.

Except for mine, that is. Mine says 400mAh. I asked a couple
of Icom tech reps and they both said something to this effect:
"Funny. Must be a misprint."

If so, then it's consistently misprinted 5 separate times on the
box, and once on the instruction sheet (dated 1991) inside the
box.

Since I don't have another BP-82 to compare it to, I think I'll put
this to a vote. Has Icom managed to stuff more battery into the same
pack, and reserved this for their pals in Japan? Or was it a weird
and wonderful misprint? If the latter, I'll have to hold onto that
box. It might be worth a fortune someday!

Anyone in Japan listening in?

Has anyone heard about the new Icom 2410 mobile dual-bander that is suppose to be released in August? It's suppose to have a mobile repeater option (like the Alinco DR590 has). This is all I know about it so far. Has anyone else heard about this new unit?

>Has anyone else heard about this new unit?

I was at the Icom day at Quement Electronics in San Jose on Saturday.
Among the items on display was a IC-2410.
Features of the new radio:
Simultaneous dual recieve - can recieve 2 signals at the same time on either
2 bands or on the same band!
DTMF remote control - you can remotely control the radio from the DTMF mike,
or from another radio!
Small - 5.5"W x 1.6"H x 6.9"D
The radio has a small cooling fan on the rear heatsink
Selective calling option
Tone squelch option
Voice frequency announce option (english or japanese)
Electronic squelch with easy threshold level setting
Independant volume controls and squelch setting switches
20db RF attenuator
Built in duplexer for dualband antennas
Programmed scan, memory scan, and priority watch functions
Auto dial capability
Total of 36 memory channels (including call channels, and scan edge channels)
Frequency coverage: RX 136-174, 440-450 Mhz TX 140-150, 440-450 Mhz
Output Power: IC2410A 144/440Mhz hi-25w, med-10w, lo-1w
: IC2410H 144Mhz hi-45w, med-10w, lo-5w
: 440Mhz hi-35w, med-10w, lo-5w
15 memory channels, 1 call channel, 2 scan edge channels per band
(no mention was made of crossband repeat, but then does Icom ever mention it?)

This looked like a very nice radio, no price has been announced yet.
The Icom reps were quite informative, and dropped a few hints about what
might be coming out in the next year.
Among the possible new products: a tri-band handi-talki (2m, 440, 1.2Ghz)

Also, it was mentioned that it is possible to use the IC-900 full duplex
on the same band, with sufficient antenna seperation.

RTTY DX Notes 1of3 7/19/91
RTTY DX Notes for week ending 19th July 1991
BID: KT7H200
Part 1 of 3.

Have you ever had one of those weeks, where nothing happens? Well
this last week has been one of those for me, and looking at the notes,
you will see that nothing has happened anywhere, at least not in the
DX field, though there are promises that things will happen soon. So
I guess that we will just have to sit back, gaze at our toes, and hope
for the best.

Our thanks for this week go to I5FLN, JG1RVN, W2FG and the Tri-State
DX Packet Cluster Network, KN3P, K4FJ, OD5NG, TG9VT, UT5RP and VK2EG.
Thank you for your help, even under difficult conditions that have
been prevailing over the past few weeks. Lets all hope for better DX
in the near future.

SB RTTYDX @ ALLBBS $KT7H202
RTTY DX Notes 3of3 7/19/91
RTTY DX Notes for week ending 19th July 1991
BID: KT7H202
Part 3 of 3.

QSL Information.

EP2ASZ, Saeed, says to QSL to Box 14155-1941, Teheran, or via IK6GZM.

HP1XBH says to send his cards via W4YC.

ZK1CQ is ZL1AMO when he is at home, so send the cards to Ron at his home QTH.

Notes of Interest.

EP2ASZ cards have been received in the U.S. from IK6GZM, but it appears that so far there has been no documentation received to validate the operation.

SU1DZ has returned home and is now signing his home call of 9K2DZ.

JG1RVN says that he is not the QSL manager for XU1DX. He has received many cards. The correct QSL manager is at Box 80, Koulimachi, Tokyo 102-91 Japan. Please use that address for the XU1DX cards.

The ARRL has accepted North Korea to the countires list. It will be added to the list after the first acredited operation. The present Korea stays on the list, but as South Korea. No notification of callsign changes has been given at this time.

So far there has been no notification of the date of commencement of the Burma operation, though indications are that it is not too far away.

Dennis, ST0DZ is still waiting for the return of his RTTY gear from the shop. He hopes it will arrive any day.

It may appear that there are a lot of mailboxes listed this week. This is deliberate. At least it shows that there has been some activity from those areas while the normal operators have been asleep or not using the bands.

GL DE DX1.

This bulletin is the packet edition of the RTTY DX Notes written by VK2SG, and is edited and relayed by Tad, KT7H @ N7DUO.WA.USA.NA.
Send RTTY DX news to VK2SG @ VK2AGE.NSW.AUS.OC

An example: On 77.9 Mhz I receive the mirror of a broadcast
transmitter on 99.3 very strong. (about 30 km away)
99.3 - 77.9 = 21.4 Mhz !

I thought this unit had triple conversion with a first IF of
266.7 Mhz in NFM & AM ?

I don't know about the R1 specifically, but if you are close to a strong transmitter somewhere then you may get images and even mixing. I don't think that this is the mark of a bad radio. I was subject to these things on my R7000 living about 2000' from a 1700 watt FM transmitter.

]Guards! Arrest these men immediately!"

In 1982, I took a business trip to South Korea and brought along an IC-2AT. The customs official at Seoul found it and got very upset (I didn't have a reciprocal license - the radio was not going to be used in Korea). He insisted that I could not take it into the country. He called his supervisor, who spoke some English. The supervisor was also upset. I told him that I wasn't going to use it in country, but he didn't believe me. Finally, he asked where "the other one was." When I said I only had one, he said something to the effect "Oh. Then you can't talk to anyone. If you had told me that earlier there wouldn't have been any problem." Then he let me through customs with the radio. Wierd, eh?

1172. Hot Yaesu handhelds (not stolen)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-21 18:35:25 UTC
From: droid@kerner.sf.ca.us
Message-ID: <9107211835.AA12637@snootles>
Source record: 295145

Our company has a bunch of the commercial Yaesu UHF handhelds. (FT-7005)
Quite a rugged little rat. (One guy has dropped it so many times there is
almost no paint left on it.)

I noticed that they would run kinda hot when the antennas started to wear.
This indicated a bad match so I'd have to fix the connector (sometimes they'd
loosen up) or replace the antenna.

When I asked the techs in Cerritos, CA (the home of yaesu) about the
overheating of the units he told me that the designers opted to use your
hand as the thermal protection device. They heatsink the output xsistor to
the case behind the PTT switch. The devices can take more heat than your
hand. The moral... If it's too hot to hold, stop talking.

There is one slight flaw in this plan. You can melt your vinyl seats or
your hip when using a speaker mic.

>>disable the BCB attenuator so enhanced MW reception is possible.

I owned a TS-430 (model previous to the TS-440) and the same attenuator is
present in the BCB section. I jumpered the resistors because I wanted
to listen to Navtext (518 KHz). I found no ill effects. If there are
problems just manually put in the front panel attenuator. The reason I write
this is that I now have a TS-850 and they have the same attenuator! I bet the
same circuit is used in the TS-440 also.

1174. 1750 tone burst mod for icom IC-24AT (Long)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-21 20:09:44 UTC
From: eac@world.std.com
Message-ID: <1991Jul21.200944.28361@world.std.com>
Source record: 295147

Enabling Tone Burst on the IC-24AT
by
Eric A. Cottrell WB1HBU

BACKGROUND

Are you going over to Europe and once again facing the age-old tone burst problem? Are you tired of carrying that home-made tone encoder that looks like a bomb detonator? Are you tired of the hours practicing to whistle at 1750 Hz? If you own a IC-24AT then you have hope.

I looked into the tone burst problem several years ago when I owned a 02AT walkie. Tone Burst could be done by adding a board, but this sacrificed the DTMF board (The most important feature for American Hams). I recently bought an IC-24AT walkie. I noticed on the schematic that the microprocessor generated the 1750 tone burst! Looking at the Service manual confirmed that the same part number is used for the microprocessor on all versions. Two resistors (R61 and R62) are removed from the non-european versions to prevent the tone burst from going into the transmit audio. I thought it was strange that they installed the adjustment pot (R60) in all models until I realized that it served as a load for the output.

Another problem is that european repeaters use the seqment from 430 - 440 Mhz and US repeaters use 440 - 450 MHz. I figured that doing the "out-of band" transmit mod would solve this problem. I ordered the diodes and resistors and got the work. I was upset when after doing the mods, the tone burst did not work! I found that an additional diode (D5) has to be removed for the tone burst to work. The diode pattern ends up being the same as the italian version of the 24ET, except D13 is removed. Nothing is lost with doing the mod. The DTMF, the PL, and the Tone Squelch (UT-50) still work. The only disadvantage is the IC-24AT resets to european settings, but they can be set back to american settings with the set function.

I believe that a similar mod can be done to the 2SAT and 4SAT series. I only have a 3SAT, but opening the unit shows similar traces on the logic board. The adjustment pot is not installed on the 3SAT.

PROCEDURE

WARNING: The following procedure deals with surface mount components. If you are unfamilar with surface mount let someone who is familar with surface mount do the mod. Reworking surface mount stuff is a delicate operation. If you are still game read the QST articles on Surface mount first and get a surface mount practice kit.
Mimimum equipment need: small tweezers, small gauge silver solder,

low wattage soldering iron (prefered temperature control) with
a small tip, small cutters, a magnifier that does not need to be
held and a vise or other clamp to hold the walkie.

WARNING: This mod may void your warranty with ICOM. The author (Eric A.
Cottrell) does not offer ANY warranty, express or implied.

1. Order the two resistors and two diodes from ICOM. You may
want to order extra in case you drop one. The resistors are
tiny and can be hard to handle. The diodes are alittle better.
You may want to order the service manual to get your bearings.
The part numbers are:
(1) 7030003800 R61 Resistor ERJ3GEYJ 1M ohm (marked as 105)
(1) 7030003640 R62 Resistor ERJ3GEYJ 47K ohm (marked as 473)
(2) 1750000130 D7, D12 Diode DA204U (marked as K)

2. Make note of memory channels and set parameters of the unit.

3. Open the case. Be careful not to lose the spring in the battery
release assembly. When the two halfs are opened the logic board
is the board in the half with the display and keypad.

4. Located four empty solder pads on the logic board near the small
(5 conductor) flex cable. Install R62 (47K) first using the two
pads closer to the small flex cable.The orientation is the same
as nearby resistors. Be careful not to make any solder bridges or
burn the flex cable. Use silver solder. Install R61 (1 Meg) next
to R62 on the two remaining pads.

5. Do the out of band transmit mod (the following from the mod):
o Locate and remove the diode device in position D8
o Locate the vacant position of diode D7 and attach one of the
DA204u diodes at that location.
o Locate the vacant position of diode D12 and attach the other
DA204u diode at that position.
o If diode D13 has not been removed, remove it.
The unit will now transmit out of the amateur bands.

6. Locate and remove the diode device in position D5. This enables
the tone burst.

7. Reassemble the unit. Do reset the CPU as shown in the inside front
cover of the manual and reprogram the memory channels and settings.

USAGE

If a repeater is up, tone burst is not needed. To bring up a repeater,
press the PTT twice rapidly and hold down the button during the second
press. You should hear the 1750 Hz tone through the speaker. Only about
1/2 of a second tone is needed to open a repeater.

While I assume you would not dare transmit out-of-band in a foreign
country, I have learnt from locals that listening to police and
commercial services in some european countries (like the UK) is illegal.

Be discreet and do not walk the streets of the town center with the speaker blaring the local law enforcement frequency. Arrest with possible fines and/or jail time is not the best way to spend a vacation. I am planning to program the memory channels with all the repeater and most simplex frequencies and set the vfo to 1 MHz frequency entry to curtail accidental out-of-band transmissions.

1177. U7MIR 2m/FM

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-21 23:53:00 UTC
From: WAS%UHHEPG.BITNET@cornellc.cit.cornell.edu
Message-ID: <EACF04CC80201BD9@uhhepg.bitnet>
Source record: 295154

U7MIR is active on two meter FM voice from the MIR spacecraft.

The operating frequency is the same for packet and voice: 145.55 Mhz
simplex.

Using a 45 watt rig with a mobile ant on top of a bookcase indoors
I contacted the packet BBS on 12 July and left a ms requesting a voice
QSO on behalf of the University of Hawaii ARC.
On July 20 when I attempted to make a packet connection, Anatole,
U7MIR called me on voice.

Give it a try. Great fun!

Aloha, Walt Simmons AH6HU.

1178. Solar Terrestrial Bulletin - Documents FTPable from Stanford

SOLAR TERRESTRIAL BULLETIN

21 July, 1991

Documents FTPable from Stanford

/\

DOCUMENTS FOR UNDERSTANDING THE SOLAR REPORTS ARE NOW AVAILABLE FROM STANFORD

The fairly extensive document "Understanding Solar Terrestrial
Reports" (USTR, both Parts I and II) as well as the "Glossary of Solar
Terrestrial Terms" are now available for anonymous FTP from:
solar.stanford.edu (thanks Vicki).

The documents are in the directory:

pub/understanding_solar_terrestrial_reports

The files in this directory are:

ustr.glossary -- Glossary of Solar Terrestrial Terms
ustr.part1 -- Understanding Solar Terrestrial Reports (Part I)
ustr.part2 -- Understanding Solar Terrestrial Reports (Part II)
ustr.summary -- Summary of the USTR Documentation
ustr.toc -- Table of Contents Copied From USTR Parts I and II

The only other known FTP site which contains this information is at:
nic.funet.fi (thanks Kauto), which is a primary archive site for the reports,
alerts and warnings which are issued. If there are other sites which have
archived this information (or are archiving the data), please send a note to:
oler@hg.uleth.ca for reference purposes. Please include the location of
the data (directory).

The documentation mentioned above is also available and can be downloaded
by the general public from the STD BBS at: (403) 756-3008. This system is
available 24 hours a day.

Thanks to all those who are assisting in the redistribution of this
information. For those who are in a position or would like to assist in
the redistribution of this data to other networks or areas which are not
already being reached, send an inquiry regarding redistribution to:
oler@hg.uleth.ca. A mailing list does exist exist for those who are
redistributing this information or to those who require this time-critical
information as rapidly as possible.

1179. 470 extended receive modifications

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-22 06:58:00 UTC
From: fletcher@lode.uwyo.EDU
Message-ID: <9107220658.AA28063@ucsd.edu>
Source record: 295141

Me again,

I have discovered an omission in my posting regarding 470 receive expansion.
(INFO-HAMS #520). The final steps in my instructions re-program the normal
repeater offsets into the radio to disable the special programming mode.
I discovered this few hours later and thought for a terrifying moment that I
had broken my radio (and hence many others)! For those who haven't tripped
over this (much less figured out the omission), here be it:

Is:
X. Press the (FM) and (RPT) keys and enter 0500. (or 0060)
Y. Turn the radio off, then on again.

Should be:
X. Press the (FM) and (RPT) keys, enter 0500, then (RPT). (or 0060)

If you don't do this, the VFO you used remains in the "expansion
modification" mode (or whatever it really is).
I have also discovered the code "5555" works as well as "0000" for
the enabling code.

Reid, WB7CJO

1181. DX Bulletin

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-22 10:52:52 UTC
From: skitch@NADC.NADC.NAVY.MIL
Message-ID: <9107221052.AA16157@NADC.NADC.NAVY.MIL>
Source record: 295157

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 020 (OPDX.020)
July 22, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, ARRL Bulletin, DL6RAI, DL8OBC, W8QWI, K8YSE and ZS6BBY for the following DX information.

3B7, ST. BRANDON. FR5DX reported on one of the DX nets that he talked to 3B8CF and was informed he would not go to 3B6 until September or later.

3W, VIETNAM. Slava, UA3DK, will be in Vietnam from July 11 to 26 and will be signing 3W4DK from Hanoi. He reported to Ben, DL6RAI, of having some equipment problems and is in need of second hand equipment. Slava has also mentioned he will be organizing a DXpedition to Spratly Island (1S) in October-November.

C30, ANDORRA. Felix, DL8OBC, informs OPDX that a group of German operators, including himself, will be QRV from the Principality of Andorra for approximately one week beginning July 23rd. Activity will be both CW and SSB, on all HF bands, plus some RS-10/12 and RS-12/13 operation. Callsigns will be C30EFA, C30EHA and C30ENA. QSL information is as follows:
C30EFA via DL8OBC, Felix J. Riess, P.O. Box 12 53, W-3007 Gehrden 1
C30EHA via DL2MEH, Manfred Wolf, Lattenweiler 58, W-8990 Lindau 6
C30ENA via DH1OAH, Matthias Deutscher, Box 21, W-3003 Ronnenberg 6
All QSL's received via bureau or direct will receive a quick reply.

C9, MOZAMBIQUE. Nick, ZS6BBY, reports that the SARL has been helping the Mozambique crowd to get amateur radio off the ground again and they now see how useful amateur radio can be. There is a club station in Mozambique signing C91TDM and is on the air every weekend.

EP, IRAN. Gianluca, IK6GZM, called BARF-80 BBS and said, "EP2ASZ is still alive !!!" After the earthquake, EP2ASZ had lots of problems with his transceiver, but he has now repaired it. He is active on 14 MHz on RTTY (1st EP) and sometimes he can be found on SSB. QSL via IK6GZM.

TR, GABON. TR8JH was active Sunday on RTTY around 2130z on 14087 kHz.

VU7, LACCADIVES ISLANDS. A group from India and W2XP will be active from July 20th thru the 28th.

XT, BURKINA FASO. XT2BW was heard this weekend on 24896 kHz around 1517z. QSL via WB2YQH.

XU, KAMPUCHEA. A station signing XU1NQ has been active on 14014 kHz between 1700 to 1900z. Also check 21021 kHz around 1230z. QSL via OK1NQ.

YA, AFGHANISTAN. The Italian group is up and signing T6AS. Not much T6 activity has been heard on the Ohio/Penn DX Cluster Network. At the time this bulletin was being prepared Sunday, there were only six T6AS spots reported since 0215z July 19th. All the reports were on 20 meters (14180 and 14005 kHz). But DL6RAI reports activity on 15 meters between 1332 to 1600z on either 21280 or 21005 kHz. Also, on 20 meters between 1700 to 0100z on either 14180 or 14005 kHz. Hopefully conditions will change for stateside. QSL via IT9AZS. UPDATE: Just before print, T6AS showed on 14180 kHz around 0045z and was very weak in signal with the usual QRM!

DXCC/ARRL AWARDS COMMITTEE NEWS. It was announced, July 16th, the ARRL Awards Committe has accepted the findings of the DXAC that North Korea meets Point 1 of the ARRL Countries List Criteria. After the first accredited operation, North Korea will be added to the Countries List. Does this sound familiar? It should. The same thing was done to Peter I (3Y). In other words, the DXCC Current Country Total should not increase until someone with proper authorization and documentation operates. Also, the present Korea listed on the DXCC list will remain, but under the new name of South Korea. On another interesting note, all this could be changed before the end of the century. There is talk of unification of both North and South Korea.

SAD NOTE. David Porter, K2BPP, who was known world-wide as ZD8DX became a Silent Key on July 13.

ROMEO, 3W3RR. John, K8YSE, talked to Ed, NT2X, who reports Romeo has left the USA. The QSL cards have been printed in Japan, and after some difficulties, have arrived in Moscow. Romeo has promised to put together a team to work on the QSL cards and that is his first priority. He has picked up the cards that were sent to Bulgaria and will send them out in Moscow to save funds. Incoming mail is a problem in the Soviet Union, but Romeo reports no trouble with the Bulgarian route. According to NT2X, U.S. individuals have been donating funds in support of Romeo's DXpedition, along with U.S. clubs and associations. Romeo is planning to attend the Dayton Hamvention in 1992.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

|>
|>Thankee.
|>

Yes, that's an easy mod. Any outfit competent to repair a TS440 should be
able to figure it out without any help, but in any case, the details
are as follows (from a note I wrote about 3 years ago):

----
The TS-440, and (from what I understand) many other general coverage
receivers, is strangely insensitive in the 500-1600 kHz range. It
turns out that this is deliberate. I don't really understand the sort
of reasoning that would make a radio designer do such a thing, though.
In any case, if you want to do AM MW broadcast DXing, or listen to
stations in the maritime service just below 545 kHz, this is a big
drawback. So I did some checking... and found that the problem is easy
to fix. The following applies to the TS-440, but similar approaches
could be used on other radios that do the same.

The RF unit (X44-1680-00) begins with a set of diode switched bandpass
filters. One of them has hidden inside it a pi-type attenuator (looks
like about 20 dB or so). That's the bandpass for 500-1600 kHz. On the
schematic it's near the bottom left of the RF unit diagram: R12, R13,
and R14. The solution, obviously, is to remove R13 and R14, and
replace R12 by a jumper wire.

Procedure: take off the bottom cover of the radio, and turn it upside
down. The big board facing you is the RF unit; it has a shield
covering a rectangular area near the middle. Remove this shield (3
```

screws) and the 7 screws holding the board in place. Disconnect enough plugs that you can turn the board upside down.

On the bottom, you'll see another shield covering the same area covered by the top shield -- which happens to be the area with the bandpass filters. Unsolder it (solder wick comes in handy here). Now look at the component side. Near the right edge of the shielded area, among lots of capacitors and inductors, you will find three resistors: two standing up (R13 and R14, 68 ohm) and one lying down between them (R12, 220 ohm). On the solder side, you will notice that all the other sections have I-shaped pieces of foil, but this one section has two L-shaped pieces (actually L and inverted L with the bases near each other). That's where these three resistors are soldered in... so remove them and replace R12 -- the one lying down -- by a wire. Solder the bottom shield back into place, and reinstall everything.

Done... You will notice that the atmospheric noise level no longer drops 2 S points when you tune from 499.99 kHz to 500.00.

1184. Ham Shack Weather Station Experiences/Opinions Solicited

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-22 14:10:45 UTC
From: waco@cbnewse.cb.att.com
Message-ID: <1991Jul22.141045.6566@cbnewse.cb.att.com>
Source record: 295160

I would like to purchase a weather station for my ham shack. I have only seen one brand, Azimuth, advertised in QST and CQ. I would like opinions of anyone who has one of these units or another brand that might be available (address to write for information would be appreciated in this case). I have seen the Heathkit models in their catalog, but they seem to be way overpriced.

I am interested in the following types of feedback:

1. How well they actually work.

2. Quality of construction, outside components especially.

3. Durability.

4. Etc.

Any information would be appreciated.

There is a QST article in the late 70's or early 80's on adding the WARC bands to the TS820. I came across it while scanning back issues of QST in my local library. Shouldn't be too hard to locate by scanning the annual index.

|> anyone have information over whether this product is an isolated new item or
|> if it represents the start of such a product line?
|>
|> Also, anyone know anything about the quality of the meter itself?

This weekend I saw the meter. It is made my Comet Antenna company. I have used there 1.2 GHz meter and have been very happy with it. In this area Comet and Diamond are the companies of choice for VHF/UHF and above!

Now how long till Radio Shack starts selling a dual-band radio!
